HANDBOOK

OF

CHEMISTRY AND PHYSICS

A READY-REFERENCE BOOK OF CHEMICAL AND PHYSICAL DATA

THIRTIETH EDITION

EDITOR IN CHIEF

CHARLES D. HODGMAN, M.S.

Associate Professor of Physics at Case School of Applied Science

IN COLLABORATION WITH A LARGE NUMBER OF PROFESSIONAL CHEMISTS AND PHYSICISTS WHOSE ASSISTANCE IS ACKNOWLEDGED IN THE LIST OF GENERAL COLLABORATORS AND IN CONNECTION WITH THE PARTICULAR TABLES OR SECTIONS INVOLVED.

PUBLISHED BY

CHEMICAL RUBBER PUBLISHING CO.

2310 Superior Ave. N. E. Cleveland, Ohio

Printed in U.S.A.

PREFACE

The Handbook of Chemistry and Physics, continuing the policy of the past, is being revised at frequent intervals.

The general features and scheme of arrangement, which have received extensive endorsement in former editions have been retained. The aim throughout has been to present in condensed form as large an amount of accurate, reliable and up-to-date information in the fields of chemistry and physics as was consistent with convenience in form and the possibility of wide utility and distribution. A very large proportion of the tables have been compiled especially for the Handbook from various authoritative collections of data and from the current journals.

Since the beginning special consideration has been given to the requests and suggestions of those who have used former editions. In this way it has been hoped to develop the book along lines most acceptable to those interested in a volume of this type. Suggestions and contributions are received each year from many eminent chemists and physicists including members of the teaching profession and those engaged in industrial work. We believe this coöperation to have been of very great value in the growth and development of the work.

An attempt has been made to include material on all branches of chemistry and physics and the closely allied sciences, which would be likely to find any extended use. On the other hand, in order to retain the convenience of moderate dimensions and at the same time allow for natural growth due to the extension of knowledge in these sciences, and logical additions along lines already developed, it has seemed necessary to exclude types of material of use only in certain highly specialized lines of work.

Chemistry and physics, always closely related sciences, have been brought into much more intimate relations by the more recent developments of research. To an increasing extent the student of either science should have a knowledge of the other. It would seem that there should be a large field for a single volume containing the constants and formulæ of the two sciences together with mathematical and conversion tables adequate for

accurate computation. The generous response which the previous editions have met indicates that the volumes have been found useful and it is with the hope of even more completely meeting the needs of the chemists and physicists of the English-speaking world that succeeding editions are offered.

CHEMICAL RUBBER PUBLISHING CO.

CLEVELAND, OHIO

PREFACE TO THE THIRTIETH EDITION

Tables originally occupying over one hundred pages have been more or less completely revised for the Thirtieth Edition of the Handbook of Chemistry and Physics. This, with the new material which has been added, represents a total of about one hundred and forty pages of new composition.

To those interested in atomic and nuclear physics one of the most useful changes will probably prove to be the replacement of several separate tables giving information concerning isotopes and radioactivity by a recent single compilation listing the properties of all artificial and natural radioactive isotopes and stable isotopes. More complete and more recent data are made readily available in a single table. A long list of references provides a very complete bibliography of the subject of nuclear physics.

The mathematical section has been modified by the substitution of a more convenient and more complete table of natural logarithms, and by some minor rearrangement of tabular material.

The growing importance of synthetic rubber is reflected by the addition of a new table giving a large range of physical properties of natural and synthetic rubber stocks.

In food chemistry the completely new presentation of the material on vitamins, will be of value. Much added information is now presented and in a more readily available form. A comprehensive table of dietary allowances has been added.

The section on viscosity has been largely revised, many items added and more recent values given.

An improved list of persistent lines of the elements replaces the former table.

Several other tables have undergone more or less complete revision and minor changes, and additions have been made throughout the volume.

COLLABORATORS AND CONTRIBUTORS

to the

HANDBOOK OF CHEMISTRY AND PHYSICS

ALBRIGHT, J. G., Ph.D. Professor and Head of Department of Physics, Rhode Island State College.
ALLEN, S. J. M., Ph.D. Professor of Experimental Physics, University of Cincinnati.
ASHLEY, R. H., Ph.D. Professor of Chemistry, The St. Lawrence University.
BAXTER, ROBERT A., M.A. Associate Professor of Chemistry, Colorado School of Mines.
BENFORD, FRANK, B.E.E. Research Laboratory, General Electric Company, Schenectady, New York.
CORK, JAMES M., Ph.D. Associate Professor of Physics, University of Michigan.
CURRIE, LAUCHLIN M., Ph.D. Research Laboratories National Carbon Company, Inc., Cleveland, Ohio.
DEMING, H. G., Ph.D. Professor of Physical Chemistry, University of Nebraska.
DE VRIES, THOMAS, Ph.D. Professor of Physical Chemistry, Purdue University.
DUNN, MAX S., Ph.D. Associate Professor of Chemistry, University of California at Los Angeles.
GASKILL, H. V., Ph.D. Dean of Division of Science, Iowa State College.
HALE, HARRISON, Ph.D. Professor and Head of the Chemistry Department, University of Arkansas.
HARKINS, WILLIAM D., Ph.D. Professor of Chemistry, University of Chicago.
HARTMAN, W. W., Ph.D. Department of Synthetic Chemistry, Eastman Kodak Company, Rochester, New York.
HAYNES, F. B., M.S. Associate Professor of Physics, Virginia Polytechnic Institute.
HOYT, CREIG S. Ph.D. Professor of Chemistry, Grove City College.
JORDAN, CHARLES NEAL, Ph.D. Assistant Professor of Chemistry, St. Louis University School of Medicine.
LEWIS, HOWARD BISHOP, Ph.D. Professor of Biological Chemistry, Director of the College of Pharmacy, Medical School, University of Michigan.
LYONS, EDWARD, Ph.D. Research Laboratories, Parke, Davis & Company, Detroit, Michigan.
MARTIN, JOHN R., M.S. Associate Professor of Electrical Communication, Case School of Applied Science.

MARVEL, C. S., Ph.D. Professor of Organic Chemistry, University of Illinois.

MASON, THOMAS W., M.S. Associate Professor of Analytical Chemistry, Penn. State College.

PARKER, CHARLES B. U. S. Patent Office, Washington, D.C.

PATTERSON, AUSTIN M., Ph.D. Professor of Chemistry and Vice President, Antioch College.

PETERS, F. N., Ph.D. Director of Research, Quaker Oats Company, Chicago, Illinois.

POST, HOWARD W., Ph.D. Assistant Professor of Chemistry, The University of Buffalo.

PREBLUDA, H. J., Ph.D. Manager Special Products Sales, U. S. Industrial Chemicals, Inc., New York City.

PRETTYMAN, IRVEN B., The Firestone Tire and Rubber Company, Akron, Ohio.

PRUTTON, C. F., Ph.D. Professor and Head of Department of Chemical Engineering, Case School of Applied Science.

RANDALL, MERLE, Ph.D. Professor of Chemistry, University of California.

RENNERFELT, IVAR. Electro-Metallurgist, Stockholm, Sweden.

ROBERTS, ROBERT C., Ph.D. Professor of Chemistry, Colgate University.

ROUSH, G. A., M.S. Editor of *Mineral Industry*, Bethlehem, Pennsylvania.

SHEELY, M. L. Assistant General Superintendent, Armour and Company, Chicago, Illinois.

SHEPPARD, ODEN E., Ph.D. Professor and Head of Chemistry and Industrial Chemistry, Montana State College.

SHIPMAN, CHARLES H. The Dodd Company, Cleveland, Ohio.

SWEENEY, ORLAND RUSSEL, Ph.D. Professor and Head of the Department of Chemical Engineering, Iowa State College.

TURRILL, PARK L. Department of Chemistry, Glendale Junior College.

WENIGER, W., Ph.D. Professor and Head of Department of Physics, Oregon State Agricultural College.

YOE, JOHN H., Ph.D. Professor of Chemistry, University of Virginia.

YOUNG, THOMAS F., Ph.D. Associate Professor of Chemistry, University of Chicago.

In addition to the above, assistance in special fields is acknowledged in connection with the various contributions, particularly the Physical Constants of Inorganic Compounds and the Physical Constants of Organic Compounds.

The Publishers and Editor will be grateful to readers of this Handbook who will call their attention to errors which may be discovered. Suggestions for improvement are also welcome.
CHEMICAL RUBBER PUBLISHING COMPANY

CONTENTS

CONTENTS

PROPERTIES AND PHYSICAL CONSTANTS

GENERAL CHEMICAL TABLES

CONTENTS

HEAT

HYGROMETRIC AND BAROMETRIC TABLES

CONTENTS

CONTENTS

ANTIDOTES OF POISONS

Acetic Acid.—Emetics, magnesia, chalk, soap, oil.

Acetylene.—Same as for carbon monoxide.

Arsenic, Rat Poison, Paris Green.—Milk, raw egg, sweet oil, lime water, flour and water.

Carbolic Acid.—Any soluble non-toxic sulphate, after provoking vomiting with zinc sulphate; uncooked white of egg in abundance, milk of lime, saccharate of calcium, olive or castor oil with magnesia in suspension, ice, washing the stomach with equal parts water and vinegar; give alcohol or whiskey or about four fluid ounces camphorated oil at one dose.

Carbon Monoxide.—Remove to fresh air immediately and call for pulmotor; apply artificial respiration for at least one hour or until the pulmotor arrives. Administration of oxygen containing 5% of carbon dioxide is beneficial; inhalation of ammonia or amyl nitrite is often of value.

Chloroform, Chloral, Ether.—Dash cold water on head and chest, artificial respiration.

Ethylene.—Same as for carbon monoxide.

Gas (illuminating).—Same as for carbon monoxide.

Hydrochloric Acid.—Magnesia, alkali carbonates, albumen, ice.

Hydrocyanic or Prussic Acid.—Hydrogen peroxide internally, and artificial respiration, breathing ammonia or chlorine from chlorinated lime, ferrous sulphate followed by potassium carbonate, emetics, warmth.

Iodine.—Emetics, stomach siphon, starchy foods in abundance, sodium thiosulphate.

Lead Acetate.—Emetics, stomach siphon, sodium, potassium or magnesium sulphates, milk, albumen.

Mercuric Chloride or Corrosive Sublimate.—Zinc sulphate, emetics, stomach siphon, white of egg, milk, chalk, castor oil, table salt, reduced iron.

Nitrate of Silver.—Salt and water.

Nitric Acid.—Same as for hydrochloric acid.

Opium, Morphine, Laudanum, Paregoric, etc.—Strong coffee, hot bath. Keep awake and moving at any cost.

Phosphoric Acid.—Same as for hydrochloric.

Sodium Hydroxide or Potassium Hydroxide.—Vinegar, lemon juice, orange juice, oil, milk.

Sulfuric Acid—Same as for hydrochloric acid with the addition of soap or oil.

Sulfurous Acid or Sulfur Dioxide.—Mustard plaster on chest; narcotics, expectorants.

Wood Alcohol (Methyl Alcohol or Methanol).–Emetic or wash out stomach (stomach tube) with a solution of 10 grains sodium citrate per ounce of water. Give milk, white of egg or flour in water; purgative of magnesium sulfate (15 grams); stimulate and combat collapse. In case of cardiac or pulmonary failure use artificial respiration. Physicians may administer atropine, digitalin or strychnine as stimulants; to cause perspiration and elimination of the poison use 0.1 grain of pilocarpine hydrochloride.

BURNS AND SCALDS

Exclude air by thin paste of starch, flour, or baking soda. Ordinary oils such as Vaseline petroleum jelly, olive or castor oil, lard or cream may also be used except for phosphorus burns. Lime water mixed with an equal part of raw linseed oil makes an excellent dressing. An especially valuable material for all burns is picric acid gauze which may be applied in the form of a compress.

After treatment with any of the above materials, cover with a cloth or with cotton and hold in place with a light bandage.

Apply a freshly prepared 5% tannic acid solution. Place several layers of sterile gauze over the burned area, saturate with the tannic acid solution and bandage loosely.

ACID AND ALKALI BURNS

With either, wash off as quickly as possible with a large quantity of water. Water from a tap may be allowed to flow over burns.

Acids

While the injury is being washed, have procured lime water or lime water and raw linseed oil mixed together in equal proportions or a mixture of baking soda and water or soap suds and apply freely. For acid in the eye wash as quickly as possible with water and then with lime water.

Alkalis

Wash with a large quantity of water as for acid burns. Neutralize with weak vinegar, hard cider or lemon juice. For lime or other strong alkali burns in the eye wash with weak solution of vinegar or with olive oil or a saturated solution of boric acid.

FIRE PRECAUTIONS AND CHEMICAL HAZARDS

Acetone.—Dilute with a spray of water to avoid spread of burning liquid. Use suitable gas mask.

Alcohol.—See under acetone.

Ammonia.—Use water and dilute acid. Use suitable gas mask.

Benzol or Benzene.—Use water to cool containers which are endangered; extinguish flame with sand, earth, fire-foam or carbon tetrachloride fire extinguishers. Use suitable gas mask.

Calcium Carbide.—Do not use water as this generates acetylene, an inflammable and explosive gas; cut off electric current to avoid ignition of gas. Remove containers to a dry place. Use gas mask.

Carbon Disulfide.—Use water to cool containers which are endangered; extinguish blaze with sand, earth, fire-foam or carbon tetrachloride fire extinguishers. Use suitable gas mask.

Carbon Tetrachloride.—Do not use a fire extinguisher filled with carbon tetrachloride (pyrene or carbona) on flames caused by an electrical short circuit in a confined space; the carbon tetrachloride may be decomposed into toxic gases.

Celluloid.—Use large volumes of water and sand. The smoke contains oxides of nitrogen which are injurious. Use suitable gas mask.

Chlorine.—Spray with water. The pungent nature of the gas makes the use of a gas mask imperative.

Collodion.—See under carbon disulfide.

Ether.—See under carbon disulfide.

Gasoline.—See under carbon disulfide.

Hydrochloric Acid.—Use large volumes of water also chalk or soda. Use gas mask.

Hydrocyanic or Prussic Acid.—Suitable gas mask is essential because of the extremely poisonous nature of the vapors. Provide ventilation.

Lacquer Solvents.—See under carbon disulfide.

Magnesium.—Do not use water. Use sand or earth to extinguish flames. Remove containers to a dry place.

Nitric Acid and Oxides of Nitrogen.—Use large volumes of water. Do not use sand or earth. Use gas mask.

FIRE PRECAUTIONS (Continued)

Potassium.—Do not use water. Remove containers to a dry place. Extinguish flames with sand or earth. For storage, potassium is kept immersed in petroleum.

Potassium Hydroxide.—Use large volumes of water or dilute acids.

Phosphorus.—Use water and wet sand. Use gas mask. For storage, white phosphorus must be kept immersed in water. Red phosphorus is less dangerous.

Sodium.—See under potassium.

Sodium Hydroxide.—See under potassium hydroxide.

Sulfur.—Extinguish with water or sand. Use gas mask.

Sulfuric Acid.—See under hydrochloric acid.

Turpentine.—See under acetone.

MATHEMATICAL TABLES

USE OF MATHEMATICAL TABLES

For a complete discussion of the principles and use of mathematical tables, textbooks on the subject should be consulted. The following brief statements are intended to give only sufficient information to make possible the intelligent use of the tables, omitting for the most part any attempt at treating the theory and principles.

Exponential Method of Expressing Numbers—For convenience in writing and manipulation, numbers are often expressed as factors of appropriate powers of 10. The following examples will illustrate:

2,380,000,000.	may be written	2.38×10^9
238.	may be written	2.38×10^2
.238	may be written	2.38×10^{-1}
.000000238	may be written	2.38×10^{-7}

Logarithms—The logarithm of a number is the exponent of that power to which another number, the base, must be raised to give the number first named. Any positive number greater than 1 might serve as a base. Two have been selected, yielding two systems of logarithms. One base, 2.718 . . . . usually indicated by the letter e, gives rise to a system of logarithms convenient in higher mathematics. These are called natural, Napierian, or hyperbolic logarithms. Reference will be made to their use in a subsequent paragraph.

The other base used is 10, giving logarithms particularly adapted to use in computation, called common or Briggian logarithms. Tables of logarithms given without designation are invariably of this latter type.

Since most numbers are incommensurable powers of ten, a common logarithm, in general, consists of an integer which is called the characteristic and an endless decimal, the mantissa.

It is to be observed that the common logarithms of all numbers expressed by the same figures in the same order with the decimal point in different positions have different characteristics but the same mantissa. To illustrate:—if the decimal point stand after the first figure of a number, counting from the left, the characteristic is 0; if after two figures, it is 1; if after three figures, it is 2, and so forth. If the decimal point stand before the first significant figure the characteristic is -1, usually written $\bar{1}$; if there is one zero between the decimal point and the first significant figure it is $\bar{2}$ and so on. For example: $\log 256 = 2.40824$, $\log 2.56 = 0.40824$, $\log 0.256 = \bar{1}.40824$, $\log 0.00256 = \bar{3}.40824$. The two latter are often written $\log 0.256 = 9.40824 - 10$, $\log 0.00256 = 7.40824 - 10$.

USE OF MATHEMATICAL TABLES (Continued)

A method of determining characteristics of logarithms is to write the number with one figure to the left of the decimal point multiplied by the appropriate power of 10. The characteristic is then the exponent used. For example:

$$256{,}000{,}000 = 2.56 \times 10^{8} \qquad \log = 8.40824$$
$$0.000000256 = 2.56 \times 10^{-7} \qquad \log = \bar{7}.40824 \text{ or } 3.40824-10$$

Inasmuch as the characteristic may be determined by inspection the mantissas only are given in tables of common logarithms.

To find the logarithm of a number:

For a number of four figures, take out the tabular mantissa on a line with the first three figures of the number and under its fourth figure. The characteristic is determined as previously explained.

For a number of less than four figures, supply zeros to make a four figure number and take the value of the mantissa from the tables as before. For example: $\log 2 = \log 2.000 = 0.30103$.

For a number of more than four figures, take the tabular value of the mantissa for the first four figures; find the difference between this mantissa and the next greater tabular mantissa and multiply the difference so found by the remaining figures of the number as a decimal and add the product to the mantissa of the first four figures. For example: to find log 46.762.

$$\log 46.76 = 1.66987$$

Tabular difference between this mantissa and that for 4677 is .00010.

$$\begin{aligned} \therefore \log 46.762 &= 1.66987 + .2 \times .00010 \\ &= 1.66987 + .00002 \\ &= 1.66989 \end{aligned}$$

To find the number corresponding to a given logarithm:

If the mantissa is found exactly in the table, join the figure at the top which is directly above the given mantissa to the three figures on the line at the left and place the decimal point according to the characteristic of the logarithm. For example, $\log^{-1}$ (antilogarithm) $3.39967 = 2510.$

If the mantissa is not found exactly in the table it is necessary to interpolate. For example, $\log^{-1} 3.40028 = 2513. + {}^{9}/_{18} = 2513.5.$

The column of proportional parts at the right of each page of the table shows, under the heading of the various tabular differences, the parts of these differences which correspond to the digits from 1 to 9 in the fifth place. This makes it possible to take out a logarithm for a five figure number or to find an antilogarithm of the same number of significant figures with increased facility, usually by inspection.

USE OF MATHEMATICAL TABLES (Continued)

The following formulae express the relations on which the use of logarithms is based:

$$\log ab = \log a + \log b$$

$$\log \frac{a}{b} = \log a - \log b$$

$$\log a^n = n \times \log a$$

$$\log \sqrt[n]{a} = \frac{\log a}{n}.$$

The following examples will serve as illustrations:

1. $52600 \times 0.00381 \times 2.74 = 549.1$

$$\begin{aligned} \log 52600 &= 4.72099 \\ \log 0.00381 &= \bar{3}.58092 \\ \log 2.74 &= 0.43775 \\ \hline \text{Sum:} &= 2.73966 \\ \text{Antilogarithm} &= 549.1 \end{aligned}$$

The sum is the logarithm of the product, the mantissa of which is 73966. On looking up this mantissa in the logarithm tables we see that it corresponds to the digits 5491. The characteristic is 2, hence there are three figures before the decimal point. The number corresponding to the logarithm, called the antilogarithm, is 549.1.

2. $0.00123 \div 52.7 = 0.00002334$

			An Alternative method:	
log 0.00123	= $\bar{3}.08991$		log 0.00123	= 7.08991 −10
log 52.7	= 1.72181		log 52.7	= 1.72181
Subtracting	$\bar{5}.36810$			5.36810 −10
Antilog	0.00002334			

The characteristic $\bar{5}$ (5. −10) shows four zeros after the decimal point before the first significant figure.

3. $\dfrac{273 \times 780}{292 \times 760} \times 15 \times 0.09 = 1.295$

log 273	= 2.43616	log 292	= 2.46538
log 780	= 2.89209	log 760	= 2.88081
log 15	= 1.17609		
log 0.09	= $\bar{2}.95424$	log denominator	= 5.34619
log sum	= 5.45858		

$$\begin{aligned} \text{log numerator} &= 5.45858 \\ \text{log denominator} &= 5.34619 \\ \hline \text{subtracting} &= 0.11239 \\ \text{antilogarithm} &= 1.295 \end{aligned}$$

USE OF MATHEMATICAL TABLES (Continued)

As division may be accomplished by multiplying by the reciprocal of a number, the above may be considerably simplified. The logarithm of the reciprocal of a number, called the cologarithm, is readily obtained from the table by subtracting the logarithm of the number from zero. This may readily be read off from the table of mantissas. Change the sign of the characteristic algebraically adding to it -1, then mentally subtract each figure of the mantissa from 9 proceeding from left to right, the last figure being subtracted from 10. The example then is:

$$
\begin{array}{lrl}
\log & 273 & = 2.43616 \\
\log & 780 & = 2.89209 \\
\log & 15 & = 1.17609 \\
\log & 0.09 & = \bar{2}.95424 \\
\text{colog} & 292 & = \bar{3}.53462 \\
\text{colog} & 760 & = \bar{3}.11919 \\
\hline
 & & 0.11239
\end{array}
$$

4. $(0.00098)^4 = 9.224 \times 10^{-13}$

$$
\begin{array}{lrl}
\log 0.00098 & = \bar{4}.99123 & \\
 & 4 & \\
\hline
 & 3.96492 & \text{(a)} \\
\bar{4} \times 4 & \overline{16}. & \text{(b)} \\
\hline
\log (0.00098)^4 & = \overline{13}.96492 & \\
\text{antilog} = 9.224 \times 10^{-13} & & \text{(c)}
\end{array}
$$

An alternative method:

$$
\begin{array}{lr}
\log 0.00098 = & 6.99123-10 \\
 & 4 \\
\hline
 & 27.96492-40 \\
\text{or} & 7.96492-20 \\
\text{or} & \overline{13}.96492 \\
\text{antilog} = & 9.224 \times 10^{-13}
\end{array}
$$

In the above it will be noted that the mantissa is always positive hence the multiplication of the mantissa shown at (a) while (b) shows the multiplication of the characteristic. (c) is the algebraic sum.

5. $\sqrt[5]{492} = 3.455$

$\log 492 = 2.69197$

Dividing the logarithm by 5 gives as the logarithm of the root 0.53839 the antilogarithm of which is 3.455 both characteristic and mantissa being positive. When the characteristic is negative and not evenly divisible by the root to be taken a modification of the logarithm is necessary.

6. $\sqrt[3]{0.000372} =$

$$
\begin{array}{rll}
\log 3.72 \times 10^{-4} & = \bar{4}\ 57054 & \text{(a)} \\
 & = 26.57054 - 30 & \text{(b)}
\end{array}
$$

dividing (b) by 3 gives $8.85685-10$ which may be written

$\bar{2}.85685$ and is the logarithm of the root sought, the antilogarithm of which is 0.07192.

$$
\begin{array}{lll}
7. & 0.000372^{1.2} & = 0.000076674 \\
 & \log 0.000372 & = \bar{4}.57054 \\
 & & \text{or } 6.57054-10 \\
 & & \qquad\qquad 1.2 \\
\hline
 & & 7.88465-12 \\
 & \text{antilogarithm} & 0.000076674
\end{array}
$$

Four-Place Logarithms—This short table on two facing pages makes possible logarithmic computation precise to four significant figures, (three without interpolation). The mantissa is given complete and the proportional parts indicated for each line.

Four-Place Antilogarithms—Some computers prefer to use separate tables for determining antilogarithms; the table being entered from the margins with the logarithm and the number being found in the body of the table. Such a table is given to accompany the four-place logarithms.

Five-Place Logarithms—For computation involving five significant figures, (four without interpolation) the five-place table will be adequate. Since the first two figures will be the same for several lines of the table they are given in the first line only. The point at which these first two figures change is indicated by an asterisk. While space does not permit the proportional parts for each line, tables will be found for each tabular difference.

The supplementary table following the five-place logarithms, giving seven-place logarithms for numbers of five significant figures from 10,000 to 12,000 will be found convenient to increase precision and avoid the inconvenience of interpolation where the differences are large.

Logarithms of the Trigonometric Functions—Logarithms of the functions are given for each minute from 0-360°.

The quantity -10 is to be appended to all logarithms of the sine and cosine, to logarithms of the tangent from 0-45° and of the cotangent from 45-90°.

With degrees indicated at either side of the top of the page use the column headings at the top. With degrees stated at the bottom of the page use the column designations at the bottom.

With degrees at the left (top or bottom) use the minute column at the left, and with degrees on the right side of the page use the minute column at the right.

USE OF MATHEMATICAL TABLES (Continued)

To illustrate the proper employment of headings for angles in the four quadrants—

log sin 6° 24′ = 9.04715 − 10	log sin 186° 24′ = 9.04715 − 10
log sin 83° 15′ = 9.99698 − 10	log sin 263° 15′ = 9.99698 − 10
log cos 96° 41′ = 9.06589 − 10	log cos 276° 41′ = 9.06589 − 10
log cos 173° 49′ = 9.99747 − 10	log cos 353° 49′ = 9.99747 − 10

For the accurate determination of values where the tabular differences are large, the values of CS and CT are given. The following equations indicate their use.

To find the logarithm of the functions of an angle:

For angles 0–3°	For angles 87–90°
$\log \sin \theta = \log \theta'' - CS$	$\log \cos \theta = \log (90° - \theta)'' - CS$
$\log \tan \theta = \log \theta'' - CT$	$\log \cot \theta = \log (90° - \theta)'' - CT$
$\log \cot \theta = \operatorname{colog} \tan \theta$	$\log \tan \theta = \operatorname{colog} \cot \theta$

To find the angle:

For angles 0–3°	For angles 87–90°
$\log \theta'' = \log \sin \theta + CS$	$\log (90° - \theta)'' = \log \cos \theta + CS$
$\log \theta'' = \log \tan \theta + CT$	$\log (90° - \theta)'' = \log \cot \theta + CT$

In the above expressions, θ'' and $(90° - \theta)''$ are used to indicate the value of the angles expressed in seconds. The values in the body of the table are the cologarithms and should be used as indicated above.

The values of the logarithms S and T are also given in a separate table. For these the following relations hold:

To find the functions of an angle.

$\log \sin \theta = \log \theta'' + S$	$\log \cos \theta = \log (90° - \theta)'' + S$
$\log \tan \theta = \log \theta'' + T$	$\log \cot \theta = \log (90° - \theta)'' + T$

To find the angle.

$\log \theta'' = \log \sin \theta - S$	$\log (90° - \theta)'' = \log \cos \theta - S$
$\log \theta'' = \log \tan \theta - T$	$\log (90° - \theta)'' = \log \cot \theta - T$

Where the values of CS and CT are given, the angles expressed in seconds are given in the supplementary column at the left.

The tabular differences are given under the headings "d" and "c.d.", the latter referring to the common difference for the tangent and cotangent. Tables of proportional parts ("P.P.") facilitate interpolation. At the bottom of each column will be found special proportional parts between the tabular differences for the tangent or cotangent and those for the sine or cosine. These are useful when one function is to be obtained directly from the other without determining the angle.

For example, suppose log tan θ is given as 9.67644 and log cos θ is required. The difference between the given logarithm and that given in the table, 9.67622 (opposite 25° 23′), is 22.

The tabular differences of the two logarithmic functions at this place are 32 and 6. In the proportional table for $\frac{6}{32}$, 22 corresponds to 4; this, subtracted from the tabular logarithmic cosine 9.95591, gives the required log cos θ = 9.95587.

The symbols $\bar{5}$ and $\dot{5}$ are used to indicate how the terminal 5 has been derived. For example, the logarithm 8.83075 is more fully given as 8.8307495 while the value $9.4082\dot{5}$ is derived from 9.4082539.

Natural Trigonometric Functions—Values of the natural trigonometric functions of angles are given for each minute from 0–360°.

For degrees indicated at the top of the page use the column headings at the top. For degrees indicated at the bottom use the column indications at the bottom.

With degrees at the left of each block (top or bottom), use the minute column at the left and with degrees at the right of each block use the minute column at the right.

Natural Functions and their Logarithms are given for angles in degrees and tenths from 0 to 90 degrees.

Natural Functions and their Logarithms are given for angles in radians and hundredths, from 0 to 2 radians.

Haversines—Values of $(1 - \cos \theta)/2$ for angles between 0 and 180° are given to four significant figures. The four-place mantissas of the logarithms of the haversines are also given. The correct characteristic must be provided in each case.

The listed values of the haversines were derived from values which were computed to seven significant figures. The logarithms were independently derived from the more exact values of the haversines and are, therefore, in many cases not the exact value of the logarithm of the haversine as listed. This is notably true at the beginning of the table where the logarithm can be given with more exactness than the function.

Natural Logarithms—The natural logarithms of numbers from 0.000 to 999. are given in a group of four tables. The method of finding logarithms of numbers not included in the tables is indicated at the beginning of the third page. A convenient table of constants occurs at the top of the fourth page.

The first page gives the natural logarithms of numbers from 0.000 to 0.499. Since the characteristics change rapidly for the smaller numbers, they are indicated *above* the mantissa in the first line. In the second and following lines the characteristics are given at the left only. For example, $\log_e 0.004 = -5.52146$; $\log_e 0.014 = -4.26870$.

The succeeding pages give the natural logarithms of numbers up to 999.

USE OF MATHEMATICAL TABLES (Continued)

Exponential Functions—Values of e^x, log e^x and e^{-x} where e is the base of the natural system of logarithms 2.71828 . . . and x has values from 0 to 10. Facilitating the solution of exponential equations, these tables also serve as a table of natural or Naperian antilogarithms. For instance if the logarithm or exponent $x = 3.26$ the corresponding number or value of e^x is 26.050. Its reciprocal e^{-x} is .038388.

Hyperbolic Functions—The table gives the values and logarithms of the hyperbolic sine x, cosine x, tangent x and cotangent x for values of x from 0 to 5.

Degrees-Radians—This table gives the value in radians to five significant figures; for each 10 minutes from 0° 0′ to 90° 0′; for each degree from 90 to 180; for each 10 degrees from 180 to 480. Values are also given for each minute from 0–60′ and for each second from 0–60″.

Tables are also provided to facilitate changing from degrees and decimal fractions to radians, from decimal fractions of a degree to minutes and seconds and the reverse operations.

Numerical Tables—The first section gives the reciprocals of numbers from 0 to 1000 and circumferences and areas of circles with diameters having these values. Reciprocals and circumferences for values not listed can be obtained by an appropriate shift of the decimal point.

The second section is devoted to squares, cubes and roots. The squares and cubes from 1 to 1000 are given exactly. The roots are given to seven significant figures. Since the square roots of $10n$ are given, values of the square roots from 1 to 10,000 may be found directly. For the square roots of numbers below and above this range, use may be made of the following relations: $\sqrt{100n} = 10\sqrt{n}$; $\sqrt{1000n} = 10\sqrt{10n}$; $\sqrt{\tfrac{1}{10}n} = \tfrac{1}{10}\sqrt{10n}$; $\sqrt{\tfrac{1}{100}n} = \tfrac{1}{10}\sqrt{n}$; $\sqrt{\tfrac{1}{1000}n} = \tfrac{1}{100}\sqrt{10n}$. For example, the square root of 0.268 may be found by using the form, $\sqrt{0.268} = \tfrac{1}{100}\sqrt{10 \times 268}$. The tabular value for the square root of $10n$ for 268 is 51.76872. Hence, the desired root is 0.5176872.

Values of cube roots for all numbers from 1 to 100,000 will be found directly in the table. Cube roots for numbers above or below this range will be found from the following relations: $\sqrt[3]{1000n} = 10\sqrt[3]{n}$; $\sqrt[3]{10{,}000n} = 10\sqrt[3]{10n}$; $\sqrt[3]{100{,}000n} = 10\sqrt[3]{100n}$; $\sqrt[3]{\tfrac{1}{10}n} = \tfrac{1}{10}\sqrt[3]{100n}$; $\sqrt[3]{\tfrac{1}{100}n} = \tfrac{1}{10}\sqrt[3]{10n}$; $\sqrt[3]{\tfrac{1}{1000}n} = \tfrac{1}{10}\sqrt[3]{n}$. For example, the cube root of 731,000 may be found

by using the form, $\sqrt[3]{731{,}000} = 10\sqrt[3]{731}$. The tabular value of the root for 731 is 9.008223. The desired root is, therefore, 90.08223.

Powers of Numbers—This table is given to supplement the values of squares and cubes of numbers found in the preceding numerical table. The larger numbers are expressed exponentially to at least seven significant figures. The approximate value written as a whole number may be obtained by shifting the decimal point to the right by the number of places indicated in the exponent of 10 shown at the head of each group of values. For example: the approximate value of 33^8 is found in the table as 14.064086×10^{11}. Written as a whole number it is 1,406,408,600,000.

Factorials and their Logarithms—The product $n \times (n-1) \times (n-2) \times \cdots \times 1$ is called factorial n, expressed as $n!$ or $\underline{|n}$. For example: factorial $5 = 5 \times 4 \times 3 \times 2 \times 1 = 120$. Factorials are very often met with in series. For purposes of computation in such cases the table giving the values of the factorials and of their logarithms for numbers from 1 to 100 is provided. The values of the factorials are expressed exponentially to 5 significant figures.

A brief table of exact values and reciprocals of factorials is to be found on page 161.

Factors for Computing Probable Errors—The probable error of a series of n measures $a_1, a_2, a_3 \ldots a_n$, the mean of which is m, is given by the expression,

$$e = \frac{0.6745}{\sqrt{n-1}}\sqrt{(m-a_1)^2 + (m-a_2)^2 + \cdots (m-a_n)^2}$$

The probable error of the mean is,

$$E = \frac{0.6745}{\sqrt{n(n-1)}}\sqrt{(m-a_1)^2 + (m-a_2)^2 + \cdots (m-a_n)^2}$$

The following approximate equations are convenient forms for computation,

$$e = 0.8453\frac{\Sigma d}{\sqrt{n(n-1)}}$$

$$E = 0.8453\frac{\Sigma d}{n\sqrt{n-1}}$$

The symbol Σd represents the arithmetical sum of the deviations.

For convenience in computing the probable error the value of several of the factors involved is given for values of n from 2 to 100.

Probability of Occurrence of Deviations—The significance of deviations is indicated by this table. The probability of occurrence of deviations as great as or greater than any specific value is given for various ratios of deviation to probable error and also with respect to the standard deviation σ. The probability of occurrence is stated in per cent or chances in 100. The odds against occurrence are also stated. The probable error is $0.6745 \times (\sigma)$.

Areas, Ordinates and Derivatives of the Normal Curve of Error—If, for a large number of observations, the frequency y, of the occurrence of an error of magnitude t be plotted, a curve results whose equation may be written,

$$y = \frac{1}{\sqrt{2\pi}} e^{-t^2/2}$$

The area, ordinates and derivatives for this curve given in the table are useful in the treatment of observational data. A text on statistical methods should be consulted for a complete explanation.

Factors and Primes—The table presents the prime factors of *all* factorable numbers and the logarithms of all prime numbers from 1 to 2000.

MISCELLANEOUS CONSTANTS

Mean radius of the earth, 3959 miles = 6371 kilometers.

1 degree of latitude at 40° = 69 miles.

1 nautical mile = 1′ of arc on the earth's surface at the equator.

Mean density of the earth, 5.522 grams per cm^3.

Constant of gravitation, $K = 6.670 \times 10^{-8}$ = the attraction in dynes between two gram masses one centimeter apart.

Acceleration due to gravity at sea level, lat. 45° = 980.616 cm. per sec. per sec. = 32.172 feet per sec. per sec.

Length of seconds pendulum at sea level, lat. 45° = 99.356 cm. = 39.116 in.

Density of mercury at 0°C. = 13.59509 g. per cm^3.

Density of water, maximum at 3.98° C. = 0.999973 g. per cm^3

Density of dry air at 0° C. and 760 mm. = .001293 g. per cm^3.

Velocity of sound in dry air at 0° C., 33,136 cm. per sec. = 1089 feet per sec.

Velocity of light in a vacuum = 2.99776×10^{10} cm. per sec. = 9.83514×10^{8} feet per sec. = 186,272 mi./sec.

Heat equivalent of fusion of water 79.71 cal. (15° C.) per gram.

Heat equivalent of vaporization of water, 539.55 cal. (15° C.) per gram.

Coefficient of expansion of gases, .003665.

Specific heat of air, at constant pressure, 0.238.

Electrochemical equivalent of silver, 0.001118 g. per sec. per int. ampere.

Mean wave length of sodium light, .00005893 cm. or 5893. ångström units.

Absolute wave length of red cadmium line in air, 760 mm. pressure, 15° C.; 6438.4696 ångström units.

LOGARITHMS OF THE TRIGONOMETRIC FUNCTIONS

Logarithms of the functions are given for each minute from 0-360°.

The quantity -10 is to be appended to all logarithms of the sine and cosine, to logarithms of the tangent from 0-45° and of the cotangent from 45-90°.

With degrees indicated at either side of the top of the page use the column headings at the top. With degrees stated at the bottom of the page use the column designations at the bottom.

With degrees at the left (top or bottom) use the minute column at the left, and with degrees on the right side of the page use the minute column at the right.

The method of determining the functions of small angles by the auxiliary quantities S and T is given in the section explaining the use of the mathematical tables at the front of the volume.

Min.	Values of S, −10 to be appended					Values of T, −10 to be appended					Sec.

NATURAL TRIGONOMETRIC FUNCTIONS

Values of the trigonometric functions of angles for each minute from 0–360°.

For degrees indicated at the top of the page use the column headings at the top. For degrees indicated at the bottom use the column indications at the bottom.

With degrees at the left of each block (top or bottom), use the minute column at the left and with degrees at the right of each block use the minute column at the right.

NATURAL FUNCTIONS (Continued)

* Values of the cosine, tangent and cotangent for angles in the table, 1.58 radians and above, are negative.

HAVERSINES

The following table gives the values of the haversines and their logarithms for angles from 0 to 180° at 10 minute intervals. Characteristics of the logarithms are omitted.

°	0′ Value	0′ Log	10′ Value	10′ Log	20′ Value	20′ Log	30′ Value	30′ Log	40′ Value	40′ Log	50′ Value	50′ Log

NATURAL OR NAPERIAN LOGARITHMS (Continued)

To find the natural logarithm of a number which is $\frac{1}{10}$, $\frac{1}{100}$, $\frac{1}{1000}$, etc of a number whose logarithm is given, subtract from the given logarithm $\log_e 10$, $2 \log_e 10$, $3 \log_e 10$, etc.

To find the natural logarithm of a number which is 10, 100, 1000, etc times a number whose logarithm is given, add to the given logarithm $\log_e 10$, $2 \log_e 10$, $3 \log_e 10$, etc.

$\log_e 10 =$	2 30258 50930	$6 \log_e 10 =$	13 81551 05580
$2 \log_e 10 =$	4 60517 01860	$7 \log_e 10 =$	16 11809 56510
$3 \log_e 10 =$	6 90775 52790	$8 \log_e 10 =$	18 42068 07440
$4 \log_e 10 =$	9 21034 03720	$9 \log_e 10 =$	20 72326 58369
$5 \log_e 10 =$	11 51292 54650	$10 \log_e 10 =$	23 02585 09299

See preceding table for logarithms for numbers between 0 000 and 0 999

DEGREES—RADIANS

1 radian = 57° 17′ 44″.80625

	log
1 radian = 57.29577 95131 degrees	1.75812 26324
1 radian = 3437.74677 07849 minutes	3.53627 38828
1 radian = 206264.80625 seconds	5.31442 51332
1 degree = 0.01745 32925 19943 radians	8.24187 73676–10
1 minute = 0.00029 08882 08666 radians	6.46372 61172–10
1 second = 0.00000 48481 36811 radians	4.68557 48668–10

DEGREES—RADIANS

The table gives in radians the angle which is expressed in degrees and minutes at the side and top. Angles expressed to the nearest minute and second can readily be converted to radians by adding to the equivalent of the whole number of degrees the equivalents of the minutes and seconds found on the third page of this table.

DEGREES AND DECIMAL FRACTIONS TO RADIANS

The table below facilitates conversion of an angle expressed in degrees and decimal fractions into radians. To convert 25.78 into radians, find the equivalents, successively, of 20°, 5°, 0°.7, 0°.08 and add.

Deg.	Radians	Deg.	Radians	Deg.	Radians	Deg.	Radians	Deg.	Radians
10	0.174533	1	0.017453	0.1	0.001745	0 01	0.000175	0.001	0.000017

NUMERICAL TABLES
Reciprocals, Circumference and Area of Circles

As a matter of convenience, the values of 1000 $\times$ $(1/n)$ are given in the table. To obtain the actual value of the reciprocal, shift the decimal point three places to the left.

Circumferences and areas of circles are given for the values of n as the diameter.

n	$1000\frac{1}{n}$	Circumference πn	Area $\frac{\pi n^2}{4}$	n	$1000\frac{1}{n}$	Circumference πn	Area $\frac{\pi n^2}{4}$

SQUARES, CUBES AND ROOTS

Squares, Cubes and Roots

Roots of numbers other than those given directly may be found by the following relations:

$$\sqrt{100n}=10\sqrt{n};\quad \sqrt{1000n}=10\sqrt{10n};\quad \sqrt{\frac{1}{10}n}=\frac{1}{10}\sqrt{10n};\quad \sqrt{\frac{1}{100}n}=\frac{1}{10}\sqrt{n},$$

$$\sqrt{\frac{1}{1000}n}=\frac{1}{100}\sqrt{10n};\quad \sqrt[3]{1000n}=10\sqrt[3]{n};\quad \sqrt[3]{10{,}000n}=10\sqrt[3]{10n};\quad \sqrt[3]{100{,}000n}=$$

$$10\sqrt[3]{100n};\quad \sqrt[3]{\frac{1}{10}n}=\frac{1}{10}\sqrt[3]{100n},\quad \sqrt[3]{\frac{1}{100}n}=\frac{1}{10}\sqrt[3]{10n};\quad \sqrt[3]{\frac{1}{1000}n}=\frac{1}{10}\sqrt[3]{n}.$$

PROBABILITY OF OCCURRENCE OF DEVIATIONS

Valid for thirty or more samples.

Probability of occurrence, expressed as per cent, and odds against a deviation as great or greater than that designated is given for various ratios of the deviation to the probable error and to the standard deviation.

(From Pearl, Medical Biometry and Statistics, W. B. Saunders Company, publishers, by permission.)

Ratio dev. to P.E.	Probable occurrence %	Odds against, to 1	Ratio dev. to std. dev.	Probable occurrence %	Odds against, to 1

AREAS, ORDINATES AND DERIVATIVES OF THE NORMAL CURVE OF ERROR

The following table gives values of the area under the curve from the ordinate at $t = 0$ to the ordinate for the values of t given in the column at the left. Values of the ordinate and of the second, third and fourth derivatives are also given.

t	Area	Ordinate	Second derivative	Third derivative	Fourth derivative	t	Area	Ordinate	Second derivative	Third derivative	Fourth derivative

ALGEBRA

Factors and Expansions

$$(a \pm b)^2 = a^2 \pm 2ab + b^2.$$
$$(a \pm b)^3 = a^3 \pm 3a^2b + 3ab^2 \pm b^3.$$
$$(a \pm b)^4 = a^4 \pm 4a^3b + 6a^2b^2 \pm 4ab^3 + b^4.$$
$$a^2 - b^2 = (a - b)(a + b).$$
$$a^2 + b^2 = \left(a + b\sqrt{-1}\right)\left(a - b\sqrt{-1}\right).$$
$$a^3 - b^3 = (a - b)(a^2 + ab + b^2).$$
$$a^3 + b^3 = (a + b)(a^2 - ab + b^2).$$
$$a^4 + b^4 = \left(a^2 + ab\sqrt{2} + b^2\right)\left(a^2 - ab\sqrt{2} + b^2\right).$$
$$a^n - b^n = (a - b)(a^{n-1} + a^{n-2}b + \ldots . + b^{n-1}).$$
$$a^n - b^n = (a + b)(a^{n-1} - a^{n-2}b + \ldots . - b^{n-1}),$$
for even values of n.
$$a^n + b^n = (a + b)\ (a^{n-1} - a^{n-2}b + \ldots . + b^{n-1}),$$
for odd values of n.
$$a^4 + a^2b^2 + b^4 = (a^2 + ab + b^2)(a^2 - ab + b^2).$$
$$(a + b + c)^2 = a^2 + b^2 + c^2 + 2ab + 2ac + 2bc.$$
$$(a + b + c)^3 = a^3 + b^3 + c^3 + 3a^2(b + c) + 3b^2(a + c) + 3c^2(a + b) + 6abc$$
$$(a + b + c + d + \ldots)^2 = a^2 + b^2 + c^2 + d^2 + \ldots + 2a(b + c + d + \ldots) + 2b(c + d + \ldots) + 2c(d + \ldots) + \ldots$$

See also under Series

Powers and Roots

$$a^x \times a^y = a^{(x+y)}.\qquad a^0 = 1\ [\text{if } a \neq 0].\qquad (ab)^x = a^xb^x.$$

$$\frac{a^x}{a^y} = a^{(x-y)}.\qquad a^{-x} = \frac{1}{a^x}.\qquad \left(\frac{a}{b}\right)^x = \frac{a^x}{b^x}.$$

$$(a^x)^y = a^{xy}.\qquad a^{\frac{1}{x}} = \sqrt[x]{a}.\qquad \sqrt[x]{ab} = \sqrt[x]{a}\,\sqrt[x]{b}.$$

$$\sqrt[x]{\sqrt[y]{a}} = \sqrt[xy]{a}.\qquad a^{\frac{x}{y}} = \sqrt[y]{a^x}.\qquad \sqrt[x]{\frac{a}{b}} = \frac{\sqrt[x]{a}}{\sqrt[x]{b}}.$$

Proportion

If $\dfrac{a}{b} = \dfrac{c}{d}$, then $\dfrac{a + b}{b} = \dfrac{c + d}{d}$,

$$\frac{a - b}{b} = \frac{c - d}{d},\qquad \frac{a - b}{a + b} = \frac{c - d}{c + d}.$$

SUMS OF NUMBERS

The sum of the first n numbers,—

$$\Sigma(n) = 1+2+3+4+5 \ldots . + n = \frac{n(n+1)}{2}$$

The sum of the squares of the first n numbers,

$$\Sigma(n^2) = 1^2+2^2+3^2+4^2+5^2 \ldots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

The sum of the cubes of the first n numbers,

$$\Sigma(n^3) = 1^3+2^3+3^3+4^3+5^3 \ldots . + n^3 = \frac{n^2(n+1)^2}{4}$$

ARITHMETICAL PROGRESSION

If a is the first term; l, the last term; d, the common difference; n, the number of terms and s, the sum of n terms,—

$$l = a + (n-1)d \qquad s = \frac{n}{2}(a+l)$$

$$s = \frac{n}{2}\left\{ 2a + (n-1)d \right\}$$

GEOMETRICAL PROGRESSION

If a is the first term; l, the last term; r, the common ratio; n. the number of terms and s, the sum of n terms,—

$$l = ar^{n-1} \qquad s = a\frac{(1-r^n)}{1-r}$$

$$s = a\frac{(r^n-1)}{r-1} \qquad s = \frac{lr-a}{r-1}$$

If n is infinity and r^2 less than unity,—

$$s = \frac{a}{1-r}$$

FACTORIALS

$$\underline{|n} = n! = e^{-n}n^n\sqrt{2\pi n}, \text{ approximately.}$$

PERMUTATIONS

If M denote the number of permutations of n things taken p at a time,—

$$M = n(n-1)(n-2) \ldots . (n-p+1)$$

COMBINATIONS

If M denote the number of combinations of n things taken p at a time,—

$$M = \frac{n(n-1)(n-2) \ldots . (n-p+1)}{p!}$$

$$M = \frac{n!}{p!(n-p)!}$$

Quadratic Equations

Any quadratic equation may be reduced to the form, —

$$ax^2 + bx + c = 0$$

Then $$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

If $b^2 - 4ac$ is positive the roots are real and unequal.
If $b^2 - 4ac$ is zero the roots are real and equal.
If $b^2 - 4ac$ is negative the roots are imaginary and unequal.
If $b^2 - 4ac$ is a perfect square the roots are rational and unequal.

Cubic Equations

A cubic equation, $y^3 + py^2 + qy + r = 0$ may be reduced to the form, —

$$x^3 + ax + b = 0$$

by substituting for y the value, $\left(x - \frac{p}{3}\right)$. Here

$$a = \tfrac{1}{3}(3q - p^2) \text{ and } b = \tfrac{1}{27}(2p^3 - 9pq + 27r).$$

For solution let, —

$$A = \sqrt[3]{-\frac{b}{2} + \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}}, \qquad B = \sqrt[3]{-\frac{b}{2} - \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}},$$

then the values of x will be given by,

$$x = A + B,\quad -\frac{A+B}{2} + \frac{A-B}{2}\sqrt{-3},\quad -\frac{A+B}{2} - \frac{A-B}{2}\sqrt{-3}$$

If $\frac{b^2}{4} + \frac{a^3}{27} > 0$, there will be one real root and two conjugate imaginary roots.

If $\frac{b^2}{4} + \frac{a^3}{27} = 0$, there will be three real roots of which two at least are equal

If $\frac{b^2}{4} + \frac{a^3}{27} < 0$, there will be three real and unequal roots.

In the last case a trigonometric solution is useful. Compute the value of the angle ϕ in the expression, —

$$\cos\phi = -\frac{b}{2} \div \sqrt{\left(-\frac{a^3}{27}\right)},$$

then x will have the following values:—

$$2\sqrt{-\frac{a}{3}}\cos\frac{\phi}{3}, \qquad 2\sqrt{-\frac{a}{3}}\cos\left(\frac{\phi}{3} + 120^\circ\right),$$

$$2\sqrt{-\frac{a}{3}}\cos\left(\frac{\phi}{3} + 240^\circ\right).$$

APPROXIMATIONS

If a and b are small quantities, the following relations are approximately true,—

$$(1 \pm a)^m = 1 \pm ma,$$

$$(1 \pm a)^m (1 \pm b)^n = 1 \pm ma \pm nb.$$

If n is nearly equal to m,

$$\sqrt{mn} = \frac{n+m}{2}, \text{ approximately.}$$

If θ is a very small angle expressed in radians,—

$$\frac{\sin \theta}{\theta} = 1 \text{ and } \frac{\tan \theta}{\theta} = 1, \text{ approximately.}$$

SERIES

The expression in parentheses following certain of the series indicates the region of convergence. If not otherwise indicated it is to be understood that the series converges for all finite values of x.

Binomial

$$(x+y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2!} x^{n-2}y^2 + \frac{n(n-1)(n-2)}{3!} x^{(n-3)} y^3 + \dots \quad (y^2 < x^2)$$

$$(1 \pm x)^n = 1 \pm nx + \frac{n(n-1)x^2}{2!} \pm \frac{n(n-1)(n-2)x^3}{3!} + \dots \text{ etc.} \quad (x^2 < 1)$$

$$(1 \pm x)^{-n} = 1 \mp nx + \frac{n(n+1)x^2}{2!} \mp \frac{n(n+1)(n+2)x^3}{3!} + \dots \text{ etc.} \quad (x^2 < 1)$$

$$(1 \pm x)^{-1} = 1 \mp x + x^2 \mp x^3 + x^4 \mp x^5 + \dots \quad (x^2 < 1)$$

$$(1 \pm x)^{-2} = 1 \mp 2x + 3x^2 \mp 4x^3 + 5x^4 \mp 6x^5 + \dots \quad (x^2 < 1)$$

Taylor's Series

$$f(x+h) = f(x) + hf'(x) + \frac{h^2}{2!} f''(x) + \frac{h^3}{3!} f'''(x) + \dots$$

$$= f(h) + xf'(h) + \frac{x^2}{2!} f''(h) + \frac{x^3}{3!} f'''(h) + \dots$$

Maclaurin's Series

$$f(x) = f(o) + xf'(o) + \frac{x^2}{2!} f''(o) + \frac{x^3}{3!} f'''(o) + \dots$$

Exponential

$$e = 1 + \frac{1}{1} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots$$

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots$$

$$a^x = 1 + x \log a + \frac{(x \log a)^2}{2!} + \frac{(x \log a)^3}{3!} + \dots$$

LOGARITHMIC

$$\log_e x = \frac{x-1}{x} + \frac{1}{2}\left(\frac{x-1}{x}\right)^2 + \frac{1}{3}\left(\frac{x-1}{x}\right)^3 + \ldots \qquad (x > \tfrac{1}{2})$$

$$\log_e x = (x-1) - \tfrac{1}{2}(x-1)^2 + \tfrac{1}{3}(x-1)^3 - \ldots \qquad (2 > x > 0)$$

$$\log_e x = 2\left[\frac{x-1}{x+1} + \frac{1}{3}\left(\frac{x-1}{x+1}\right)^3 + \frac{1}{5}\left(\frac{x-1}{x+1}\right)^5 + \ldots\right] \qquad (x > 0)$$

$$\log_e(1+x) = x - \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 - \tfrac{1}{4}x^4 + \ldots \qquad (-1 < x < 1)$$

$$\log_e(n+1) - \log_e(n-1) = 2\left[\frac{1}{n} + \frac{1}{3n^3} + \frac{1}{5n^5} + \ldots\right]$$

$$\log_e(a+x) = \log_e a + 2\left[\frac{x}{2a+x} + \frac{1}{3}\left(\frac{x}{2a+x}\right)^3 + \frac{1}{5}\left(\frac{x}{2a+x}\right)^5 + \ldots\right] \qquad (a > 0,\ -a < x < +\infty)$$

TRIGONOMETRIC

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \ldots$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \ldots$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$\sin^{-1} x = x + \frac{x^3}{6} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{x^5}{5} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{5}{6}\cdot\frac{x^7}{7} + \ldots \qquad (x^2 < 1)$$

$$\tan^{-1} x = x - \tfrac{1}{3}x^3 + \tfrac{1}{5}x^5 - \tfrac{1}{7}x^7 + \ldots \qquad (x^2 < 1)$$

$$= \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \ldots \qquad (x^2 > 1)$$

$$\log_e \sin x = \log_e x - \frac{x^2}{6} - \frac{x^4}{180} - \frac{x^6}{2835} - \ldots \qquad (x^2 < \pi^2)$$

$$\log_e \cos x = -\frac{x^2}{2} - \frac{x^4}{12} - \frac{x^6}{45} - \frac{17x^8}{2520} - \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$\log_e \tan x = \log_e x + \frac{x^2}{3} + \frac{7x^4}{90} + \frac{62x^6}{2835} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

$$e^{\sin x} = 1 + x + \frac{x^2}{2!} - \frac{3x^4}{4!} - \frac{8x^5}{5!} - \frac{3x^6}{6!} + \frac{56x^7}{7!} + \ldots$$

$$e^{\cos x} = e\left(1 - \frac{x^2}{2!} + \frac{4x^4}{4!} - \frac{31x^6}{6!} + \ldots\right)$$

$$e^{\tan x} = 1 + x + \frac{x^2}{2!} + \frac{3x^3}{3!} + \frac{9x^4}{4!} + \frac{37x^5}{5!} + \ldots \qquad \left(x^2 < \frac{\pi^2}{4}\right)$$

MISCELLANEOUS

The Sum (Σ, = Sigma) and Product (Π, = Pi) Notations

Σ denotes the **sum**, and Π, the **product** of all quantities of a given collection. In particular,

$$\sum_{i=m}^{m+n} x_i \text{ means } x_m + x_{m+1} + \ldots + x_{m+n}, \ (n + 1 \text{ terms in all}),$$

$$\prod_{i=m}^{m+n} x_i \text{ means } x_m x_{m+1} \ldots x_{m+n}, \ (n + 1 \text{ factors in all}).$$

For indicated **range**, R, (such as $m \leqq i \leqq m + n$), one may write $\sum_R x_i$, $\prod_R x_i$, respectively. Where the range is clear from the context one writes Σx_i, Πx_i, or even Σx, Πx, respectively. For c a constant and for x_i and y_i with common range (say of n elements),

$$\Sigma c x_i = c \Sigma x_i, \ \Sigma(x_i + y_i) = \Sigma x_i + \Sigma y_i, \ \Sigma(x_i + c) = nc + \Sigma x_i.$$

Special Numerical Relations

(i) For range, $i = 1, 2, \ldots, n$, with $x_i = i$.
$\Sigma x_i = n(n + 1)/2$, $\Sigma(2x_i - 1) = n^2$,
$\Sigma x_i^2 = n(n + 1)(2n + 1)/6$.
$\Sigma x_i^3 = (\Sigma x_i)^2$, $\Sigma x_i^4 = (\Sigma x_i^2)[6(\Sigma x_i) - 1]/5$.
$\Pi(c + 1 - x_i) = c^{(n)}$, $\Pi x_i = n^{(n)} = n!$ ("**factorial** n").
Hence $n! = n \, . \, (n - 1)!$ $0!$ is defined to be 1.
Stirling's formula (used for n large),

$$\sqrt{2n\pi}(n/e)^n < n! < \sqrt{2n\pi}(n/e)^n\left(1 + \frac{1}{12n - 1}\right),$$
$$(\pi = 3.14159 \ldots, e = 2.71828 \ldots).$$

$n!/(n-m)!$ gives the number of **permutations of** n **distinct things taken** m **at a time.**

(ii) For range, $i = -\left(\frac{n-1}{2}\right), -\left(\frac{n-1}{2}\right) + 1, \ldots, \left(\frac{n-1}{2}\right) - 1, \left(\frac{n-1}{2}\right)$, with $x_i = i$ (whether n is odd or even),

$$\sum x_i = \sum x_i^3 = 0, \sum x_i^2 = \frac{n(n^2 - 1)}{12}, \sum x_i^4 = \frac{3n^2 - 7}{20} \sum x_i^2.$$

(iii) The Binomial Coefficients, $\binom{n}{m}$.

$\binom{n}{m} = n!/[(n-m)!m!]$, for integers m, n, $0 \leqq m \leqq n$. $\binom{n}{0} = \binom{n}{n} = 1$.

$(x+c)^n = \sum_r \binom{n}{r} x^{n-r} c^r$, $(0 \leqq r \leqq n)$, the **binomial expansion.** $\binom{n}{m}$ gives also the number of **combinations of n distinct things taken m at a time.**

$\binom{n}{m} + \binom{n}{m+1} = \binom{n+1}{m+1}$, **recursion relation** for binomial coefficients.

$$\binom{n}{n-m} = \binom{n}{m}, \quad \sum_r (-1)^r \binom{n}{r} = 0, \quad \sum_r \binom{n}{r}^2 = \binom{2n}{n}, \quad \sum_{s=m}^{n} \binom{s}{m} = \binom{n+1}{m+1}.$$

Table of Binomial Coefficients

n	$\binom{n}{0}$	$\binom{n}{1}$	$\binom{n}{2}$	$\binom{n}{3}$	$\binom{n}{4}$	$\binom{n}{5}$	$\binom{n}{6}$	$\binom{n}{7}$	$\binom{n}{8}$	$\binom{n}{9}$	$\binom{n}{10}$
0	1										
1	1	1									
2	1	2	1								
3	1	3	3	1							
4	1	4	6	4	1						
5	1	5	10	10	5	1					
6	1	6	15	20	15	6	1				
7	1	7	21	35	35	21	7	1			
8	1	8	28	56	70	56	28	8	1		
9	1	9	36	84	126	126	84	36	9	1	
10	1	10	45	120	210	252	210	120	45	10	1
11	1	11	55	165	330	462	462	330	165	55	11
12	1	12	66	220	495	792	924	792	495	220	66
13	1	13	78	286	715	1287	1716	1716	1287	715	286
14	1	14	91	364	1001	2002	3003	3432	3003	2002	1001
15	1	15	105	455	1365	3003	5005	6435	6435	5005	3003
16	1	16	120	560	1820	4368	8008	11440	12870	11440	8008
17	1	17	136	680	2380	6188	12376	19448	24310	24310	19448
18	1	18	153	816	3060	8568	18564	31824	43758	48620	43758
19	1	19	171	969	3876	11628	27132	50388	75582	92378	92378
20	1	20	190	1140	4845	15504	38760	77520	125970	167960	184756

NOTE: $\binom{n}{m} = \dfrac{n(n-1)(n-2)\ldots(n-m+1)}{m(m-1)(m-2)\ldots 3.2.1}$; $\binom{n}{0} = 1$; $\binom{n}{1} = n$.

For coefficients missing from the above table, use the relation

$\binom{n}{m} = \binom{n}{n-m}$, e.g. $\binom{20}{11} = \binom{20}{9} = 167960$.

Finite Differences

For equi-spaced arguments x_i, and associated y_i, the successive **advancing y-differences** are, $\Delta^0 y_i = y_i$, $\Delta y_i = y_{i+1} - y_i$, $\Delta^2 y_i = \Delta y_{i+1} - \Delta y_i = y_{i+2} - 2y_{i+1} + y_i, \ldots,$ $\Delta^m y_i = \Delta^{m-1} y_{i+1} - \Delta^{m-1} y_i = \sum_r (-1)^r \binom{m}{r} y_{i+m-r}$. With arbitrary origin A and class-interval length, $x_{i+1} - x_i = h$, using $u_i = (x_i - A)/h$, write $y(u_i)$ for y_i. Then if for some fixed m, for the portion of the table considered, the values of $\Delta^{m+1} y_i$ be zero (or approximately, if these be regarded as negligible) **Newton's formula** gives

$$y(u) = \sum \frac{u^{(r)}}{r!} \Delta^r y(0) = y(0) + u\Delta y(0) + \frac{u(u-1)}{1 \cdot 2} \Delta^2 y(0) + \cdots + \frac{u(u-1)\ldots(u-m+1)}{m!} \Delta^m y(0).$$

This formula reduces to an identity for $u = u_0, u_1, \ldots, u_n$, $(u_i = i)$, and may be used to interpolate for intermediate values.

Example. Given

x	−4,	−2,	0,	2,	4,	6,	8,	...
y	10,	14,	30,	64,	122,	210,	334,	...

to find a value for y when $x = 10$, and when $x = 1$. Suppose for some reason A has been taken at $x = 2$. The work may be arranged as follows:

u	x	y	Δ	Δ^2	Δ^3	Δ^4
−3	−4	10				
			4			
−2	−2	14		12		
			16		6	
−1	0	30		18		0
			34		6	
0	2	64		24		0
			58		6	
1	4	122		30		0
			88		6	
2	6	210		36		—
			124		—	
3	8	334		—		—
			—		—	
—	—	—		—		—

$$y(u) = 64 + 58u + 30\frac{u(u-1)}{1 \cdot 2} + 6\frac{u(u-1)(u-2)}{1 \cdot 2 \cdot 3}$$
$$= 64 + 58u + 15u(u-1) + u(u-1)(u-2).$$

At $x = 10$, $u = 4$. Substituting $u = 4$, one has $y|_{x=10} = 500$.
At $x = 1$, $u = -\frac{1}{2}$. Substituting $u = -\frac{1}{2}$, one has $y|_{x=1} = 44\frac{5}{8}$.

STATISTICS

Central Measures

Here the range of i is from 1 to n. With each value x_i is associated a weighting factor $f_i \geq 0$ (such as the frequency, the probability, the mass, the reliability, or other multiplier).

N, the **total weight**, $= \Sigma f_i$.

$\bar{x}$, the **arithmetic mean**, $= \Sigma f_i x_i / N = \Sigma f_i x_i / \Sigma f_i$.

GM, the **geometric mean** (available when each x_i is positive), $= \sqrt[N]{\Pi x_i^{f_i}}$. $\operatorname{Log} GM = \Sigma f_i \log x_i / N$.

Mo, the **mode**, = value among $(x_1, \ldots, x_n)$ having maximum associated f_i (usually obtained by interpolating after the data are graduated). For unweighted items, x_i, a mode is a value about which the values of x_i cluster most densely.

RMS, the **root-mean-square**, $= \sqrt{\Sigma f_i x_i^2 / N}$.

Md, the **median** (see below). For unweighted items, the median is the value, equaled or exceeded by exactly half of the values x_i in the given list. In case of a central pair, the median is usually taken as the arithmetic mean of this pair.

Mm, the **mid-mean** (see below). For unweighted items, the mid-mean is the arithmetic mean of the half-list obtained upon dropping out the highest quarter and lowest quarter of the items.

Cum $f|_X$, the value of "cumulative f" at X, $= \sum_{x_i < X} f_i$ (interpolation being used for X if necessary).

The M-Tiles

For **ungrouped data**, X is called the **r**th **m-tile** (or **r**th **m-tile mark**) ($r = 0, 1, \ldots, m$) if simultaneously, $\sum_{x_i < X} f_i / N \leq r/m$, and $\sum_{x_i > X} f_i / N \leq (m - r)/m$. In particular the zeroth m-tile is **min**, the minimal value among the list $(x_1, \ldots, x_n)$, and the mth m-tile is **max**, the maximal value among the list.

For **grouped data**, the rth m-tile mark, X, is such that

$$\text{Cum } f|_X = Nr/m, \quad (r = 0, 1, 2, \ldots, m).$$

$$\text{Cum } f|_{\min} = 0, \qquad \text{Cum } f|_{\max} = N.$$

In particular, certain intermediate $(0 < r < m)$ m-tile marks are named as follows:

m	$r = 1$	2	3	. . .
2	Md (median)			
3	T_1 (lower tertile)	T_2 (upper tertile)		
4	Q_1 (lower quartile)	Md	Q_3 (upper quartile)	
10	D_1 (first decile)	D_2	D_3	etc.
100	PC_1 (first percentile)	PC_2	PC_3	etc.

The term "rth **m-tile**" ($r = 1, \ldots, m$) is also used to denote the class interval extending from the $(r-1)$st to rth m-tile mark as defined above.

Mm, the **mid-mean,** =

$$2 \sum_{Q_1 \le x_i \le Q_3} f_i x_i / N = \sum_{Q_1 \le x_i \le Q_3} f_i x_i \Big/ \sum_{Q_1 \le x_i \le Q_3} f_i.$$

When each x_i is positive, and not all are equal, one always has $0 < \min < GM < \bar{x} < RMS < \max$.

For moderately-skewed distributions, one has approximately $Mo - \bar{x} = 3(Md - \bar{x})$, or $3Md = Mo + 2\bar{x}$.

Measures of Dispersion and Skewness

Here A is an arbitrary reference value, usually a convenient integral measure near $\bar{x}$.

ν_k, kth **moment about** A, $= \Sigma f_i(x_i - A)^k/N$, $(k = 0, 1, \ldots)$.

$\nu_0 = 1$, $\nu_1 = \bar{x} - A$. ν_2 as function of A is minimum for $A = \bar{x}$.

μ_k, kth **moment about** $\bar{x}$, $= \Sigma f_i(x_i - \bar{x})^k/N$, $(k = 0, 1, \ldots)$.

$$\begin{aligned}
\mu_0 &= 1,\\
\mu_1 &= 0,\\
\mu_2 &= \nu_2 - \nu_1^2 \ (\mu_2 = \text{variance}),\\
\mu_3 &= \nu_3 - 3\nu_1\nu_2 + 2\nu_1^3,\\
\mu_4 &= \nu_4 - 4\nu_1\nu_3 + 6\nu_1^2\nu_2 - 3\nu_1^4.\\
\beta_1 &= \mu_3^2/\mu_2^3,\ \beta_2 = \mu_4/\mu_2^2.
\end{aligned}$$

σ, **standard deviation,** $= \sqrt{\mu_2}$.

$\alpha_3/2$, **momental skewness;** $\alpha_3 = \sqrt{\beta_1} = \mu_3/\sigma^3$.

$(\alpha_4 - 3)/2$, **kurtosis;** $\alpha_4 = \beta_2$.

MD, **mean deviation** (from the mean), $= \Sigma f_i|x_i - \bar{x}|/N$

$$= 2\left[\bar{x}\sum_{x_i<\bar{x}} f_i - \sum_{x_i<\bar{x}} f_i x_i\right]/N.$$ (This latter form is convenient for computation.)

s, **quartile deviation,** $= |Q_3 - Q_1|/2$.

$P.E.$, **probable error,** $= 0.6745\sigma$.

V, **coefficient of variation,** $= 100\sigma/\bar{x}\ \%$.

Pearson's measure of skewness $= (\bar{x} - Mo)/\sigma$. (Usually approximately $\alpha_3/2$.)

Bowley's measure of skewness $= (Q_3 - 2Md + Q_1)/(2s)$.

(Bowley's measure of skewness lies between -1 and $+1$.)

The Class Interval

$$\Delta x_i = x_{i+1} - x_i.$$

For equi-spaced arguments, $\Delta x_i = h$, the **length of the class interval,** x_i is the **mid-value** or **class mark.** The interval from $x_i - (h/2)$ to $x_i + (h/2)$ is the **class interval** with these as given **initial** and **terminal end values.**

$$\begin{aligned} u_i &= (x_i - A)/h. \\ \bar{u} &= \Sigma f_i u_i/N,\ \bar{x} = h\bar{u} + A. \\ (\mu_k)_x &= h^k(\mu_k)_u,\ (k = 0, 1, \ldots). \\ \sigma_u{}^2 &= [\Sigma f_i u_i{}^2/N] - \bar{u}^2,\ \sigma_x = h\sigma_u. \\ (\beta_1)_x &= (\beta_1)_u,\ (\beta_2)_x = (\beta_2)_u. \end{aligned}$$

Sheppard's corrections (to correct approximately for the error due to treating all elements in a given class interval of length h as though concentrated at the class mark).

For μ_0, μ_1, μ_3, no corrections.

In x-units,

corrected $(\mu_2)_x$ = uncorrected $(\mu_2)_x - h^2/12$,

corrected $(\mu_4)_x$ = uncorrected $(\mu_4)_x - h^2$ uncorrected $(\mu_2)_x/2 + 7h^4/240$.

In u-units, replace h by 1 in the formulae given above.

Least Squares

The **normal equations** for finding coefficients, $a_0, a_1, \ldots, a_m$, in fitting a curve of the form $y = a_0 + a_1x + \ldots + a_mx^m$ to data (X_i, Y_i), $i = 1, \ldots, n$, $(n > m)$, are $m + 1$ in number as follows:

$$\begin{aligned} \Sigma Y_i &= a_0n + a_1\Sigma X_i + a_2\Sigma X_i{}^2 + \ldots + a_m\Sigma X_i{}^m, \\ \Sigma X_iY_i &= a_0\Sigma X_i + a_1\Sigma X_i{}^2 + a_2\Sigma X_i{}^3 + \ldots + a_m\Sigma X_i{}^{m+1}, \\ &\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \\ \Sigma X_i{}^mY_i &= a_0\Sigma X_i{}^m + a_1\Sigma X_i{}^{m+1} + a_2\Sigma X_i{}^{m+2} + \ldots + a_m\Sigma X_i{}^{2m}. \end{aligned}$$

Deviation from fitted curve,

$$d_i = Y_i - (a_0 + a_1X_i + \ldots + a_mX_i{}^m).$$

$$\Sigma d_i{}^2 = \Sigma Y_i{}^2 - (a_0\Sigma Y_i + a_1\Sigma X_iY_i + \ldots + a_m\Sigma X_i{}^mY_i).$$

For $z = ab^x$, use $y = \log z$, $a_0 = \log a$, $a_1 = \log b$.

For $z = at^p$, use $y = \log z$, $a_0 = \log a$, $a_1 = p$, $x = \log t$.

S_y, **standard error of estimate,** = root-mean-square of the y-deviations about a fitted curve $= \sqrt{\Sigma d_i{}^2/n}$.

Simple Correlation

Product Moment Method

Given n equi-spaced measurements X_i, $i = 1, 2, \ldots, n$, with $h = X_{i+1} - X_i$, $x_i = X_i - \bar{X}$; and m equi-spaced measurements Y_j, $j = 1, 2, \ldots, m$, with $k = Y_{j+1} - Y_j$, $y_j = Y_j - \bar{Y}$; and a weight (frequency, probability, etc.) e_{ij} (≥ 0), associated with (X_i, Y_j). Here e_{ij} is an entry in the table.

$$f_i = \sum_j e_{ij},\; g_j = \sum_i e_{ij}.$$

$$N = \sum_{ij} e_{ij} = \sum_i f_i = \sum_j g_j. \quad \text{(Check)}$$

$$\bar{x} = \sum_{ij} e_{ij}X_i/N = \sum_i f_i X_i/N;\; \bar{y} = \sum_{ij} e_{ij}Y_j/N = \sum_j g_j Y_j/N.$$

Let A and B be arbitrary reference values, usually convenient integral measures near $\bar{X}$ and $\bar{Y}$, respectively.

$u_i = (X_i - A)/h,\; v_j = (Y_j - B)/k;$

$\bar{u} = \Sigma f_i u_i/N,\; \bar{X} = h\bar{u} + A,\; \bar{v} = \Sigma g_j v_j/N,\; \bar{Y} = k\bar{v} + B.$

$\sigma_u^2 = (\mu_2)_u = (\Sigma f_i u_i^2/N) - \bar{u}^2,\; \sigma_x = h\sigma_u.$ } Apply Sheppard's

$\sigma_v^2 = (\mu_2)_v = (\Sigma g_j v_j^2/N) - \bar{v}^2,\; \sigma_y = k\sigma_v.$ } corrections.

$$U_j = \sum_i e_{ij}u_i,\; V_i = \sum_j e_{ij}v_j,\; P = \sum u_i V_i = \sum v_j U_j. \quad \text{(Check)}$$

$$p_{uv} = \sum_{ij} e_{ij}(u_i - \bar{u})(v_j - \bar{v})/N$$

$$= (P/N) - \bar{u}\bar{v}.$$

$p_{xy} = hkp_{uv}.$

$r = p_{uv}/(\sigma_u\sigma_v) = p_{xy}/(\sigma_x\sigma_y)$ **(product-moment) coefficient of correlation.** In every case $-1 \leq r \leq 1$.

$Y - \bar{Y} = r\dfrac{\sigma_y}{\sigma_x}(X - \bar{X})$, or $y = r\dfrac{\sigma_y}{\sigma_x}x$, **regression line of y on x.**

$X - \bar{X} = r\dfrac{\sigma_x}{\sigma_y}(Y - \bar{Y})$, or $x = r\dfrac{\sigma_x}{\sigma_y}y$, **regression line of x on y.**

Example of Computation for Product-Moment Coefficient of Correlation

v_j	u_i / y_j \ x_i	-3 / 12	-2 / 16	-1 / 20	0 / 24	1 / 28	2 / 32	g_j	g_jv_j	$g_jv_j^2$	$U_j \left(= \sum_i e_{ij}u_i\right)$	v_jU_j

f_iu_i		-6	-14	-8	0	13	6	-9				
$f_iu_i^2$		18	28	8	0	13	12	79				
$V_i \left(= \sum_j e_{ij}v_j\right)$		-4	-4	4		19	4					
u_iV_i		12	8	-4	0	19	8	43				

$A = 24,\; B = 15,$
$h = 4,\; k = 3,$
$N = \Sigma f_i = \Sigma g_j = 50,$
$\Sigma f_i u_i = -9,\; \Sigma g_j v_j = 35,$
$\Sigma f_i u_i^2 = 79,\; \Sigma g_j v_j^2 = 91,$
$P = \Sigma u_i V_i = \Sigma v_j U_j = 43.$

$\bar{u} = -9/50 = -.18 \qquad \bar{v} = 85/50 = .70$

$\sigma_u^2 = (79/50) - (-.18)^2 - .083 = 1.46, \qquad \sigma_u = 1.083$

$\sigma_v^2 = (91/50) - (.70)^2 - .083 = 1.247, \qquad \sigma_v = 1.117$

$p_{uv} = (43/50) - (-.18)(.70) = +0.986$

$r = +0\,986/(1.21 \times 1.117) = +.725 \qquad$ Ans. $r = +.815$

Rank Difference Method

Given n corresponding pairs of measured items (X_i, Y_i), $(i = 1, \ldots, n)$. Let (u_i, v_i) be the corresponding rank numbers. Here $u_i = 1$ for the largest X_i, 2 for the next largest X_i, etc., and similarly $v_i = 1$ for the largest Y_i, 2 for the next largest Y_i, etc. $\rho = 1 - \dfrac{6\Sigma(u_i - v_i)^2}{n(n^2 - 1)}$, **(rank difference) coefficient of correlation.** In every case $-1 \leq \rho \leq 1$. Check: $\Sigma(u_i - v_i) = 0$.

Example of Computation for Rank-Difference Coefficient of Correlation

X_i	Y_i	u_i	v_i	$u_i - v_i$	$(u_i - v_i)^2$	
76	52	3	1	+2	4	Check: $\Sigma(u_i - v_i) = 0$.
66	34	8	9	−1	1	
63	32	10	10	0	0	
74	45	4	4	0	0	$\rho = 1 - \dfrac{6 \times 62}{10(10^2 - 1)}$
79	50	1	2	−1	1	
69	37	7	7	0	0	
77	35	2	8	−6	36	$= +0.63$
65	42	9	5	+4	16	
71	40	6	6	0	0	Ans. $\rho = +.63$
73	48	5	3	+2	4	
$N=10$				0	62	

Probability

If among $a + b$ equi-probable and mutually exclusive events, a are regarded as favorable and b unfavorable, then for a single trial

p, probability of favorable outcome, $= \dfrac{a}{a + b}$,

q, probability of unfavorable outcome, $= 1 - p = \dfrac{b}{a + b}$.

The successive terms in the binomial expansion $(p + q)^n = \sum\limits_r \binom{n}{r} p^{n-r} q^r$ give the respective probabilities that in n trials, the event will be favorable exactly $n - r$ times, $r = 0, \ldots, n$.

The mean number of favorable events is np, of unfavorable, nq; the standard deviation is $\sigma = \sqrt{npq}$, $\alpha_3 = (p - q)/\sigma$ (the positive direction being that of increasing unfavorability).

Normal curve (x measured in σ-units from the mean, and with area = 1):

$$y = \frac{1}{\sqrt{2\pi}} e^{-x^2/2} = 0.3989 e^{-x^2/2}.$$

STATISTICS (Continued)

MD (mean deviation from the mean) $= \sigma\sqrt{2/\pi} = 0.7979\sigma$.
s (quartile deviation from the mean) $= 0.6745\sigma = 0.845\ MD$.
Percentage areas, under normal curve, for successive **class** intervals measured from the mean:

Multiples of σ: 34 %, 14 %, 2 %.
Multiples of s: 25 %, 16 %, 7 %, 2 %.

Normal surface (x measured in σ_x-units y in σ_y-units from their means),

$$z = \frac{1}{2\pi\sqrt{1 - r^2}} e^{-(x^2 - 2rxy + y^2)/[2(1-r^2)]}.$$

Goodness of Fit. For a universe of objects falling into n mutually exclusive classes with class marks, $x_i (i = 1, 2, \ldots, n)$, let p_i be the probability for the ith class. Given a sample of N items, with f_i items in the ith class ($\Sigma f_i = N$), the probability that a random sample of N items gives no better fit, expressed in terms of n and χ^2 ("Chi square"), $= \Sigma(f_i - Np_i)^2/(Np_i)$, is given by a table, portions of which are as follows:

Probability that a Random Sample Gives no Better Fit

n \ χ^2	1	2	3	4	6	8	10	15	20
3	.607	.368	.223	.135	.050	.018	.007	.001	.000

MENSURATION FORMULÆ

Plane Figures Bounded by Straight Lines

The **area of a triangle** whose base is b and altitude h

$$= \frac{hb}{2}.$$

The area of a **triangle** with angles A, B, and C and sides opposite a, b, and c, respectively

$$= \tfrac{1}{2}ab \sin C.$$

or $$= \sqrt{s(s-a)(s-b)(s-c)},$$

where $s = \frac{1}{2}(a + b + c)$.

A **rectangle** with sides a and b has an area $= ab$.

The area of a **parallelogram** with side b and the perpendicular distance to the parallel side h

$$= bh.$$

The area of a **parallelogram** with sides a and b and the included angle θ

$$= ab \sin \theta.$$

The area of a **rhombus** with diagonals c and d,

$$= \tfrac{1}{2}cd.$$

The **area** of a **trapezoid** whose parallel sides are a and b and altitude h

$$= \tfrac{1}{2}(a + b)h.$$

The area of any **quadrilateral** with diagonals a and b and the angle between them θ

$$= \tfrac{1}{2}ab \sin \theta.$$

The area of a **regular polygon** with n sides, each of length l,

$$= \tfrac{1}{4}nl^2 \cot \frac{180}{n}.$$

For a regular polygon of n sides, each side of length l, the radius of the **inscribed circle**,

$$= \frac{l}{2} \cot \frac{180}{n}.$$

The radius of the **circumscribed circle**,

$$= \frac{l}{2} \operatorname{cosec} \frac{180}{n}.$$

Area, Radius of Inscribed and Circumscribed Circles for Regular Polygons

l = length of one side.

Name.	Number of sides.	Area.	Radius of inscribed circle.	Radius of circumscribed circle.
Triangle, equilateral	3	$0.43301l^2$	$0.28867l$	$0.57735l$
Square	4	$1.00000l^2$	$0.50000l$	$0.70710l$
Pentagon	5	$1.72048l^2$	$0.68819l$	$0.85065l$
Hexagon	6	$2.59808l^2$	$0.86602l$	$1.0000l$
Heptagon	7	$3.63391l^2$	$1.0383l$	$1.1523l$
Octagon	8	$4.82843l^2$	$1.2071l$	$1.3065l$
Nonagon	9	$6.18182l^2$	$1.3737l$	$1.4619l$
Decagon	10	$7.69421l^2$	$1.5388l$	$1.6180l$
Undecagon	11	$9.36564l^2$	$1.7028l$	$1.7747l$
Dodecagon	12	$11.19615l^2$	$1.8660l$	$1.9318l$

Radius of circle inscribed in any triangle, whose sides are a, b, and c, where $s = \frac{1}{2}(a + b + c)$

$$= \frac{\sqrt{s(s-a)(s-b)(s-c)}}{s}.$$

The radius of the circumscribed circle

$$= \frac{abc}{4\sqrt{s(s-a)(s-b)(s-c)}}.$$

The perimeter of a polygon inscribed in a circle of radius r, where n is the number of sides,

$$= 2nr \sin\frac{\pi}{n}. \qquad (\pi \text{ radians} = 180°)$$

The area of the inscribed polygon,

$$= \tfrac{1}{2}nr^2 \sin\frac{2\pi}{n}.$$

The perimeter of a polygon circumscribed about a circle of radius r, number of sides n

$$= 2nr \tan\frac{\pi}{n}.$$

The area of the circumscribed polygon

$$= nr^2 \tan\frac{\pi}{n}.$$

Plane Figures Bounded by Curved Lines

The **circumference of a circle** whose radius is r and **diameter** $d (d = 2r)$

$$= 2\pi r = \pi d. \qquad (\pi = 3.14159)$$

The area of a circle

$$= \pi r^2 = \tfrac{1}{4}\pi d^2 = .7854d^2.$$

The **length of an arc** of a circle for an arc of θ degrees

$$= \frac{\pi r \theta}{180}.$$

NOTE. — In this and following similar formulæ r denotes **the radius** of the circle, (OC, Fig. 1).

For an arc of θ radians the length

$$= r\theta.$$

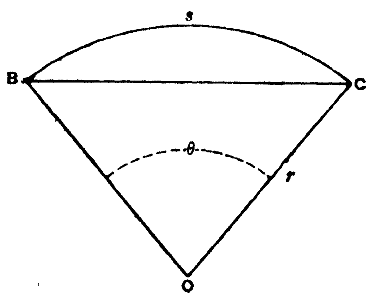

FIG 1.

The **length of a chord** subtending an angle θ

$$= 2r \sin \tfrac{1}{2}\theta.$$

The **area of a sector** where θ is the angle between the **radii** in degrees

$$= \frac{\pi r^2 \theta}{360}.$$

If s is the length of the arc, the area of the sector

$$= \frac{sr}{2}.$$

The area of a segment where θ is the angle between the two radii in degrees

$$= \frac{\pi r^2 \theta}{360} - \frac{r^2 \sin \theta}{2}.$$

If θ is in radians the area $= \frac{1}{2}r^2(\theta - \sin\theta)$.

The area of the segment of a circle

$$=\frac{\pi r^2}{2}-\left[x\sqrt{r^2-x^2}+r^2\sin^{-1}\left(\frac{x}{r}\right)\right]$$

where r is the radius of the circle and x the perpendicular distance of the chord from the center. The angle must be expressed in radians.

The area of the ring between two circles of radius r_1 and r_2, one of which encloses the other,

$$=\pi(r_1+r_2)\ (r_1-r_2).$$

The two circles are not necessarily concentric.

Area of the sector of an annulus. (Fig. 2.)—If angle $GOH = \theta$ and the lines GO and $JO = r_1$ and r_2 respectively, the area $GHIJ = \frac{1}{2}\theta(r_1+r_2)\ (r_1-r_2)$.

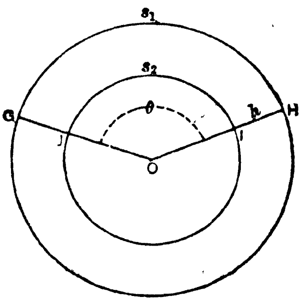

Fig. 2

If s_1 = the length of the arc GH and s_2 = the arc JI and $h = HI = r_1 - r_2$, the area $GHIJ = \frac{1}{2}h(s_1+s_2)$.

The circumference of an ellipse whose semiaxes are a and b

$$=2\pi\sqrt{\frac{a^2+b^2}{2}}\ \text{(approx.)} = 4aE \text{ exactly.}$$

See tables of elliptic integrals for E, using $K = \sqrt{\frac{a^2+b^2}{a}}$

The **area of an ellipse** $= \pi ab$.

The length of the **arc of a parabola**, as arc SPQ in Fig. 3, where $x = PR$, and $y = QR$

$$=2\sqrt{y^2+\frac{4x^2}{3}}, \text{ approximately.}$$

The **area of the section of the parabola** $PQRS$, $= \frac{4}{3}xy$.

MENSURATION FORMULAE (Continued)

Solids Bounded by Planes

The lateral area of a regular prism = perimeter of a right section $\times$ the length.

The volume of a regular prism = area of base $\times$ the altitude.

The lateral area of a regular pyramid, slant height l, length of one side of base a, and a number of sides n,

$$= \tfrac{1}{2}nal.$$

The volume of a pyramid = $\tfrac{1}{3}$ area of base $\times$ altitude.

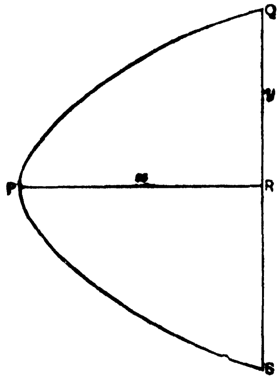

FIG. 3.

Surface and Volume of Regular Polyhedra

Surface and volume of regular polyhedra in terms of the length of one edge l.

Name.	Nature of surface.	Surface.	Volume.
Tetrahedron...	4 equilateral triangles	$1.73205l^2$	$0.11785l^3$
Hexahedron or cube	6 squares..........	$6.00000l^2$	$1.00000l^3$
Octahedron....	8 equilateral triangles	$3.46410l^2$	$0.47140l^3$
Dodecahedron .	12 pentagons........	$20.64573l^2$	$7.66312l^3$
Icosahedron ...	20 equilateral triangles	$8.66025l^2$	$2.18170l^3$

Solids Bounded by Curved Surfaces

The surface of a sphere of radius r and diameter $d(= 2r)$

$$= 4\pi r^2 = \pi d^2 = 12.57r^2.$$

The volume of a sphere

$$= \tfrac{4}{3}\pi r^3 = \tfrac{1}{6}\pi d^3 = 4.189r^3.$$

MENSURATION FORMULAE (Continued)

The **area of a lune** on the surface of a sphere of radius r, included between two great circles whose inclination is θ radians.

$$= 2r^2\theta.$$

The **area of a spherical triangle** whose angles are A, B, and C (radians) on a sphere of radius r

$$= (A + B + C - \pi)r^2.$$

The **area of a spherical polygon** of n sides where θ is the sum of its angles in radians

$$= [\theta - (n - 2)\pi]r^2.$$

The area of the curved surface of a **spherical segment** of height h, radius of sphere r

$$= 2\pi\, rh.$$

The **volume** of a **spherical segment**, data as above

$$= \tfrac{1}{3}\pi h^2 (3r - h).$$

If a = radius of the base of the segment, the volume

$$= \tfrac{1}{6}\pi h\,(h^2 + 3a^2).$$

The **curved surface** of a **right cylinder** where r = the radius of the base and h, the altitude,

$$= 2\pi rh.$$

The **volume** of a **cylinder**, data as above,

$$= \pi r^2 h.$$

The **curved surface** of a **right cone** whose altitude is h and radius of base r

$$= \pi r\,\sqrt{r^2 + h^2}.$$

The **volume** of a **cone**, data as above,

$$= \frac{\pi}{3} r^2 h = 1.047\, r^2 h.$$

The **curved surface** of the **frustum** of a **right cone**, radius of base r_1, of top r_2 and altitude h,

$$= \pi(r_1 + r_2)\,\sqrt{h^2 + (r_1 - r_2)^2}.$$

The **volume** of the **frustum** of a **cone**, data as above,

$$= \pi\frac{h}{3}\,(r_1^2 + r_1 r_2 + r_2^2).$$

The **oblate spheroid** is formed by the rotation of an ellipse about its minor axis. If a and b are the major and minor semi-axes respectively, and e the eccentricity, the surface

$$= 2\pi a^2 + \pi\frac{b^2}{e}\log_\epsilon \frac{1 + e}{1 - e},$$

and volume $= \tfrac{4}{3}\pi a^2 b.$

The prolate spheroid is formed by the rotation of an ellipse about its major axis ($2a$), data as above.

Surface $=2\pi b^2+2\pi \frac{ab}{e}\sin^{-1}e$,

volume $=\frac{4}{3}\pi ab^2$.

SIMPSON'S RULE FOR IRREGULAR AREAS

Divide the area into an even number ($2m$) of panels by means of $2m+1$ parallel lines, drawn at constant distance h apart; and denote the lengths of the intercepted segments by $y_0, y_1, \ldots, y_{2m-1}, y_{2m}$. The first and last of these may be zero. The area will then be

$$A=\frac{1}{3}h[(y_0+y_{2m})+4(y_1+y_3+\ldots+y_{2m-1})+2(y_2+y_4+\ldots+y_{2m-2})]$$

While the formula is exact in many simple cases, ordinarily the formula provides only an approximation, for which the accuracy increases with an increase in the number of divisions. Simpson's Rule may be applied to finding volumes, if the measures $y_0, y_1, \ldots, y_{2m}$ be interpreted as the areas of parallel plane sections at constant distance h apart.

PRISMOIDAL FORMULA

As a special case where $m=1$, and H, $(=2h)$ is the distance between two limiting parallel planes, one has for the volume of a solid figure,

$$V=\frac{1}{6}H(S_0+4S_1+S_2).$$

Here S_0 and S_2 are the cross-sectional areas in these limiting planes (lower and upper bases, respectively), and S_1 is the cross section of the mid-section. The formula is exact for the cone, sphere, ellipsoid, and prismoid.

TRIGONOMETRIC FUNCTIONS IN A RIGHT-ANGLED TRIANGLE

If A, B, and C are the vertices (C the right angle), and a, b, and h the sides opposite respectively,

$$\text{sine } A = \sin A = \frac{a}{h}, \qquad \text{cosine } A = \cos A = \frac{b}{h},$$

$$\text{tangent } A = \tan A = \frac{a}{b}, \qquad \text{cotangent } A = \cot A = \text{ctn } A = \frac{b}{a},$$

$$\text{secant } A = \sec A = \frac{h}{b}, \qquad \text{cosecant } A = \csc A = \frac{h}{a}.$$

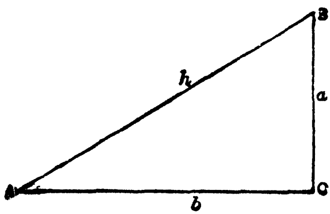

Fig. 4.

$$\text{exsecant } A = \text{exsec } A = \sec A - 1$$

$$\text{versine } A = \text{vers } A = 1 - \cos A$$

$$\text{coversine } A = \text{covers } A = 1 - \sin A$$

$$\text{haversine } A = \text{hav } A = \tfrac{1}{2} \text{ vers } A$$

cot	∞	$\sqrt{3}$	1	$\frac{1}{3}\sqrt{3}$	0	∞	0

RELATIONS OF THE FUNCTIONS

$\sin x = \frac{1}{\operatorname{cosec} x}$.

$\operatorname{cosec} x = \frac{1}{\sin x}$.

$\cos x = \frac{1}{\sec x}$.

$\sec x = \frac{1}{\cos x}$.

$\tan x = \frac{1}{\cot x} = \frac{\sin x}{\cos x}$.

$\sin^2 x + \cos^2 x = 1$

$1 + \tan^2 x = \sec^2 x$

$\cot x = \frac{1}{\tan x} = \frac{\cos x}{\sin x}$.

$1 + \cot^2 x = \operatorname{cosec}^2 x$

$\sin x = \sqrt{1 - \cos^2 x}$.

$\cos x = \sqrt{1 - \sin^2 x}$.

$\tan x = \sqrt{\sec^2 x - 1}$.

$\sec x = \sqrt{\tan^2 x + 1}$.

$\cot x = \sqrt{\operatorname{cosec}^2 x - 1}$.

$\operatorname{cosec} x = \sqrt{\cot^2 x + 1}$.

$\sin x = \cos(90 - x) = \sin(180 - x)$.

$\cos x = \sin(90 - x) = -\cos(180 - x)$.

$\tan x = \cot(90 - x) = -\tan(180 - x)$.

$\cot x = \tan(90 - x) = -\cot(180 - x)$.

$\operatorname{cosec} x = \cot \frac{x}{2} - \cot x$.

FUNCTIONS OF SUMS OF ANGLES

$\sin(x+y) = \sin x \cos y + \cos x \sin y$.

$\sin(x-y) = \sin x \cos y - \cos x \sin y$.

$\cos(x+y) = \cos x \cos y - \sin x \sin y$.

$\cos(x-y) = \cos x \cos y + \sin x \sin y$.

$$\tan(x+y) = \frac{\tan x + \tan y}{1 - \tan x \tan y}.$$

$$\tan(x-y) = \frac{\tan x - \tan y}{1 + \tan x \tan y}.$$

FUNCTIONS OF MULTIPLE ANGLES

$\sin 2x = 2 \sin x \cos x.$
$\cos 2x = \cos^2 x - \sin^2 x = 2 \cos^2 x - 1 = 1 - 2 \sin^2 x.$
$\sin 3x = 3 \sin x - 4 \sin^3 x.$
$\cos 3x = 4 \cos^3 x - 3 \cos x.$
$\sin 4x = 8 \cos^3 x \sin x - 4 \cos x \sin x.$
$\cos 4x = 8 \cos^4 x - 8 \cos^2 x + 1.$
$\sin 5x = 5 \sin x - 20 \sin^3 x + 16 \sin^5 x.$
$\cos 5x = 16 \cos^5 x - 20 \cos^3 x + 5 \cos x.$
$\sin 6x = 32 \cos^5 x \sin x - 32 \cos^3 x \sin x + 6 \cos x \sin x.$
$\cos 6x = 32 \cos^6 x - 48 \cos^4 x + 18 \cos^2 x - 1.$

$$\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}.$$

$$\cot 2x = \frac{\cot^2 x - 1}{2 \cot x}.$$

$$\tan 3x = \frac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}.$$

$$\sin \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{2}}.$$

$$\cos \tfrac{1}{2}x = \pm \sqrt{\frac{1 + \cos x}{2}}$$

$$\tan \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{1 + \cos x}} = \frac{1 - \cos x}{\sin x} = \frac{\sin x}{1 + \cos x}.$$

MISCELLANEOUS RELATIONS

$\sin x \pm \sin y = 2 \sin \tfrac{1}{2} (x \pm y) . \cos \tfrac{1}{2} (x \mp y).$
$\cos x + \cos y = 2 \cos \tfrac{1}{2} (x + y) . \cos \tfrac{1}{2} (x - y).$
$\cos x - \cos y = -2 \sin \tfrac{1}{2} (x + y) . \sin \tfrac{1}{2} (x - y).$

$$\tan x \pm \tan y = \frac{\sin (x \pm y)}{\cos x . \cos y}. \quad \cot x \pm \cot y = \frac{\pm \sin (x \pm y)}{\sin x \cdot \sin y}.$$

$$\frac{1 + \tan x}{1 - \tan x} = \tan (45 + x) \qquad \frac{\cot x + 1}{\cot x - 1} = \cot (45 - x)$$

$$\frac{\sin x \pm \sin y}{\cos x + \cos y} = \tan \tfrac{1}{2} (x \pm y).$$

$$\frac{\sin x \pm \sin y}{\cos x - \cos y} = -\cot \tfrac{1}{2} (x \mp y).$$

$$\frac{\sin x + \sin y}{\sin x - \sin y} = \frac{\tan \frac{1}{2} (x + y)}{\tan \frac{1}{2} (x - y)}.$$

$\sin^2 x - \sin^2 y = \sin (x + y) . \sin (x - y).$
$\cos^2 x - \cos^2 y = -\sin (x + y) \sin (x - y).$
$\cos^2 x - \sin^2 y = \cos (x + y) \cos (x - y).$

TRIGONOMETRIC FORMULAE (Continued)

RELATIONS BETWEEN SIDES AND ANGLES OF ANY PLANE TRIANGLE

In a triangle with angles A, B, and C and sides opposite a, b, and c respectively,

$$\frac{a}{\sin A}=\frac{b}{\sin B}=\frac{c}{\sin C}=\text{diameter of the circumscribed circle.}$$

$$a^2=b^2+c^2-2bc\cos A.$$

$$a=b\cos C+c\cos B.$$

$$\cos A=\frac{b^2+c^2-a^2}{2bc}.$$

$$\tan\frac{A-B}{2}=\frac{a-b}{a+b}\cot\frac{C}{2}.$$

$$\sin A=\frac{2}{bc}\sqrt{s(s-a)(s-b)(s-c)},$$

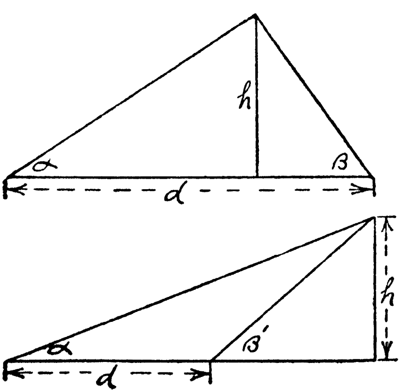
where $s=\frac{1}{2}(a+b+c)$ and $r=\sqrt{\dfrac{(s-a)(s-b)(s-c)}{s}}$.

$$\sin\frac{A}{2}=\sqrt{\frac{(s-b)(s-c)}{bc}}.$$

$$\cos\frac{A}{2}=\sqrt{\frac{s(s-a)}{bc}}.$$

$$\tan\frac{A}{2}=\sqrt{\frac{(s-b)(s-c)}{s(s-a)}}=\frac{r}{s-a}.$$

$$\frac{a+b}{a-b}=\frac{\sin A+\sin B}{\sin A-\sin B}=\frac{\tan\frac{1}{2}(A+B)}{\tan\frac{1}{2}(A-B)}=\frac{\cot\frac{1}{2}C}{\tan\frac{1}{2}(A-B)}.$$



$$h=d\frac{\sin\alpha\sin\beta}{\sin(\alpha+\beta)}=\frac{d}{\cot\alpha+\cot\beta}$$

Similarly

$$h=d\frac{\sin\alpha\sin\beta'}{\sin(\beta'-\alpha)}=\frac{d}{\cot\alpha-\cot\beta'}$$

Fig. 5.

RELATIONS IN ANY SPHERICAL TRIANGLE

If A, B and C be the three angles and a, b, and c the opposite sides,

$$\frac{\sin A}{\sin a}=\frac{\sin B}{\sin b}=\frac{\sin C}{\sin c}.$$

$$\cos a=\cos b\cos c+\sin b\sin c\cos A=\frac{\cos b\cos(c\pm\theta)}{\cos\theta}.$$

where $\tan\theta=\tan b\cos A$.

$$\cos A=-\cos B\cos C+\sin B\sin C\cos a.$$

$$\sin\tfrac{1}{2}A=\sqrt{\frac{\sin(s-b)\sin(s-c)}{\sin b\sin c}}.$$

where $s=\tfrac{1}{2}(a+b+c)$.

$$\cos\tfrac{1}{2}A=\sqrt{\frac{\sin s\sin(s-a)}{\sin b\sin c}}.$$

$$\tan\tfrac{1}{2}A=\frac{r}{\sin(s-a)}.$$

where $r=\sqrt{\dfrac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}}$.

$$\cos\tfrac{1}{2}a=\sqrt{\frac{\cos(S-B)\cos(S-C)}{\sin B\sin C}}.$$

where $S=\tfrac{1}{2}(A+B+C)$.

$$\sin\tfrac{1}{2}a=\sqrt{-\frac{\cos S\cos(S-A)}{\sin B\sin C}}.$$

$$\tan\tfrac{1}{2}a=R\cos(S-A)$$

where $R=\sqrt{\dfrac{-\cos S}{\cos(S-A)\cos(S-B)\cos(S-C)}}$.

$$\frac{\tan\frac{a+b}{2}}{\tan\frac{c}{2}}=\frac{\cos\frac{A-B}{2}}{\cos\frac{A+B}{2}},\quad\frac{\tan\frac{A+B}{2}}{\cot\frac{C}{2}}=\frac{\cos\frac{a-b}{2}}{\cos\frac{a+b}{2}}.$$

$$\frac{\tan\frac{a-b}{2}}{\tan\frac{c}{2}}=\frac{\sin\frac{A-B}{2}}{\sin\frac{A+B}{2}},\quad\frac{\tan\frac{A-B}{2}}{\cot\frac{C}{2}}=\frac{\sin\frac{a-b}{2}}{\sin\frac{a+b}{2}}$$

$$\operatorname{hav} a=\operatorname{hav}(b\sim c)+\sin b\sin c\operatorname{hav} A$$

$$\operatorname{hav} A=\frac{\sqrt{\operatorname{hav}[a+(b\sim c)]\operatorname{hav}[a-(b\sim c)]}}{\sin b\sin c}$$

ANALYTICAL GEOMETRY

The distance between two points x_1, y_1, and x_2, y_2, — rectangular coördinates:

$$d = \pm \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

For polar coördinates and points r_1, θ_1, and r_2, θ_2:

$$d = \pm \sqrt{r_1^2 + r_2^2 - 2r_1r_2 \cos(\theta_1 - \theta_2)}$$

The area of a triangle whose vertices are x_1, y_1; x_2, y_2, and x_3, y_3:

$$A = \tfrac{1}{2}(x_1y_2 - x_2y_1 + x_2y_3 - x_3y_2 + x_3y_1 - x_1y_3)$$

For polar coördinates and vertices, r_1, θ_1; r_2, θ_2, and r_3, θ_3:

$$A = \tfrac{1}{2}\{(r_1r_2 \sin(\theta_2 - \theta_1) + r_2r_3 \sin(\theta_3 - \theta_2) + r_3r_1 \sin(\theta_1 - \theta_3)\}$$

The equation of a straight line where m is the tangent of the angle of inclination and c, the distance of intersection with the Y axis from the origin:

$$y = mx + c$$

If a line of slope m passes through the point x_1, y_1 its equation is:

$$y - y_1 = m(x - x_1)$$

The equation of a line through the points x_1, y_1, and x_2, y_2 is:

$$\frac{y - y_1}{y_2 - y_1} = \frac{x - x_1}{x_2 - x_1}$$

If the intercepts on the X and Y axes are a and b respectively, the equation is:

$$\frac{x}{a} + \frac{y}{b} = 1$$

If the length of the perpendicular from the origin is p and its angle of inclination θ the equation is:

$$x \cos\theta + y \sin\theta = p$$

General equation of the straight line:

$$Ax + By + C = 0$$

The equation of a circle whose center is at a, b, and whose radius is c:

$$(x - a)^2 + (y - b)^2 = c^2$$

If the origin is at the center:

$$x^2 + y^2 = c^2$$

The polar equation of a circle with the origin on the circumference and its center at point c, α:

$$r = 2c \cos(\theta - \alpha).$$

If the origin is not on the circumference, the radius a and the center at a point l, α, the equation becomes:

$$a^2 = r^2 + l^2 - 2rl \cos(\theta - \alpha)$$

The equation of a parabola with the origin at the vertex, where f is the distance from the focus to the vertex:

$$y^2 = 4fx$$

If p is the semi-latus rectum ($=2f$) the equation is:

$$y^2 = 2px$$

The polar equation where the pole is at the focus and p the semi-latus rectum is:

$$r = \frac{p}{1 - \cos\theta}$$

If the pole is at the vertex and p as above:

$$r = \frac{2p\cos\theta}{\sin^2\theta}$$

The equation of the ellipse with the origin at the center and semi-axes a and b:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

Polar equation where the pole is at the center:

$$r^2 = \frac{a^2b^2}{a^2\sin^2\theta + b^2\cos^2\theta}$$

The equation of the hyperbola with the origin at the center, semi-axes a and b:

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

Polar equation, pole at center:

$$r^2 = \frac{a^2b^2}{a^2\sin^2\theta - b^2\cos^2\theta}$$

HYPERBOLIC FUNCTIONS

Definitions

An hyperbolic function represents a relation between the coordinates of a given portion on the arc of a rectangular hyperbola.

If O is the center, A the vertex, and P any point of the hyperbola APB,

$OM = x$, $MP = y$, $OA = a$.

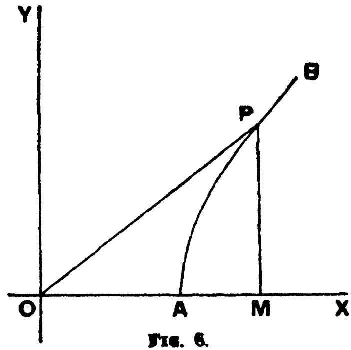


FIG. 6.

The function u may be defined by the following relation,

$$u = \frac{2 \times \text{Area OAP}}{OA^2}$$

The hyperbolic sine of $u = \sinh u = y/a$.
The hyperbolic cosine of $u = \cosh u = x/a$.

$$\sinh u = \frac{1}{2}(e^u - e^{-u}) = u + \frac{u^3}{3!} + \frac{u^5}{5!} + \cdots$$

$$\cosh u = \frac{1}{2}(e^u + e^{-u}) = 1 + \frac{u^2}{2!} + \frac{u^4}{4!} + \cdots$$

$$\tanh u = u - \frac{u^3}{3} + \frac{2u^5}{15} - \frac{17u^7}{315} + \cdots \qquad \left(u^2 < \frac{1}{4}\pi^2\right).$$

$$\sinh^{-1} u = u - \frac{1}{2}\cdot\frac{u^3}{3} + \frac{1\cdot 3}{2\cdot 4}\cdot\frac{u^5}{5} - \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\cdot\frac{u^7}{7} + \cdots \qquad (u^2 < 1).$$

$$\sinh^{-1} u = \log 2u + \frac{1}{2}\cdot\frac{1}{2u^2} - \frac{1\cdot 3}{2\cdot 4}\cdot\frac{1}{4u^4} + \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\cdot\frac{1}{6u^6} - \cdots \qquad (u^2 > 1).$$

$$\cosh^{-1} u = \log 2u - \frac{1}{2}\cdot\frac{1}{2u^2} - \frac{1\cdot 3}{2\cdot 4}\cdot\frac{1}{4u^4} - \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\cdot\frac{1}{6u^6} - \cdots \qquad (u^2 > 1).$$

$$\tanh^{-1} u = u + \frac{u^3}{3} + \frac{u^5}{5} + \frac{u^7}{7} + \cdots \qquad (u^2 < 1).$$

$$\tanh u = \frac{\sinh u}{\cosh u}. \qquad \operatorname{sech} u = \frac{1}{\cosh u}.$$

$$\coth u = \frac{1}{\tanh u}. \qquad \operatorname{csch} u = \frac{1}{\sinh u}.$$

Relations of the Functions

$$\sinh x = -\sinh(-x). \qquad \operatorname{sech} x = \operatorname{sech}(-x).$$
$$\cosh x = \cosh(-x). \qquad \operatorname{csch} x = -\operatorname{csch}(-x).$$
$$\tanh x = -\tanh(-x). \qquad \coth x = -\coth(-x).$$

$$\sinh x = \frac{2 \tanh \frac{1}{2}x}{1 - \tanh^2 \frac{1}{2}x} = \frac{\tanh x}{\sqrt{1 - \tanh^2 x}}.$$

$$\cosh x = \frac{1 + \tanh^2 \frac{1}{2}x}{1 - \tanh^2 \frac{1}{2}x} = \frac{1}{\sqrt{1 - \tanh^2 x}}.$$

$$\cosh^2 x - \sinh^2 x = 1.$$

$$\tanh x = \sqrt{1 - \operatorname{sech}^2 x}. \qquad \operatorname{sech} x = \sqrt{1 - \tanh^2 x}.$$
$$\coth x = \sqrt{\operatorname{csch}^2 x + 1}. \qquad \operatorname{csch} x = \sqrt{\coth^2 x - 1}.$$

$\sinh(\frac{1}{2}x) = \sqrt{\frac{1}{2}(\cosh x - 1)}.$
$\cosh(\frac{1}{2}x) = \sqrt{\frac{1}{2}(\cosh x + 1)}.$
$\tanh(\frac{1}{2}x) = (\cosh x - 1) \div \sinh x = \sinh x \div (\cosh x + 1).$
$\sinh(2x) = 2 \sinh x \cosh x.$
$\cosh(2x) = \cosh^2 x + \sinh^2 x = 2\cosh^2 x - 1 = 1 + 2\sinh^2 x$
$\tanh(2x) = 2 \tanh x \div (1 + \tanh^2 x).$
$\sinh 3x = 3 \sinh x + 4 \sinh^3 x.$
$\cosh 3x = 4 \cosh^3 x - 3 \cosh x.$
$\tanh 3x = (3 \tanh x + \tanh^3 x) \div (1 + 3 \tanh^2 x).$
$\sinh(x \pm y) = \sinh x \cdot \cosh y \pm \cosh x \cdot \sinh y.$
$\cosh(x \pm y) = \cosh x \cdot \cosh y \pm \sinh x \cdot \sinh y.$
$\tanh(x \pm y) = (\tanh x \pm \tanh y) \div (1 \pm \tanh x \cdot \tanh y).$
$\sinh x + \sinh y = 2 \sinh \frac{1}{2}(x + y) \cdot \cosh \frac{1}{2}(x - y).$
$\sinh x - \sinh y = 2 \cosh \frac{1}{2}(x + y) \cdot \sinh \frac{1}{2}(x - y).$
$\cosh x + \cosh y = 2 \cosh \frac{1}{2}(x + y) \cdot \cosh \frac{1}{2}(x - y).$
$\cosh x - \cosh y = 2 \sinh \frac{1}{2}(x + y) \cdot \sinh \frac{1}{2}(x - y).$

$$\sinh x + \cosh x = \frac{1 + \tanh \frac{1}{2}x}{1 - \tanh \frac{1}{2}x}$$

$$\tanh x \pm \tanh y = \frac{\sinh(x \pm y)}{\cosh x \cosh y}.$$

$$\coth x \pm \coth y = \pm \frac{\sinh(x \pm y)}{\sinh x \sinh y}.$$

Inverse Functions

$$\sinh^{-1} x = \log(x + \sqrt{x^2 + 1}) = \int \frac{dx}{\sqrt{x^2 + 1}} = \cosh^{-1} \sqrt{x^2 + 1}$$

HYPERBOLIC FUNCTIONS (Continued)

$$\cosh^{-1} x = \log\left(x + \sqrt{x^2 - 1}\right) = \int \frac{dx}{\sqrt{x^2 - 1}} = \sinh^{-1} \sqrt{x^2 - 1}.$$

$$\tanh^{-1} x = \frac{1}{2}\log(1 + x) - \frac{1}{2}\log(1 - x) = \int \frac{dx}{1 - x^2}.$$

$$\coth^{-1} x = \frac{1}{2}\log(1 + x) - \frac{1}{2}\log(x - 1) = \int \frac{dx}{1 - x^2}.$$

$$\operatorname{sech}^{-1} x = \log\left(\frac{1}{x} + \sqrt{\frac{1}{x^2} - 1}\right) = -\int \frac{dx}{x\sqrt{1 - x^2}}.$$

$$\operatorname{csch}^{-1} x = \log\left(\frac{1}{x} + \sqrt{\frac{1}{x^2} + 1}\right) = -\int \frac{dx}{x\sqrt{x^2 + 1}}.$$

Relations to Circular Functions

$$\sinh x = -i \sin ix. \qquad \sinh ix = i \sin x.$$
$$\cosh x = \cos ix. \qquad \cosh ix = \cos x.$$
$$\tanh x = -i \tan ix. \qquad \tanh ix = i \tan x.$$

If $x = \log \tan\left(\frac{\pi}{4} + \frac{\theta}{2}\right) = \log(\sec\theta + \tan\theta)$,

θ = the **gudermannian** of x = gd x.

$$\sinh x = \tan \operatorname{gd} x. \qquad \tanh x = \sin \operatorname{gd} x.$$
$$\cosh x = \sec \operatorname{gd} x. \qquad \tanh \tfrac{1}{2} x = \tan \tfrac{1}{2} \operatorname{gd} x.$$

$$\frac{d \operatorname{gd} x}{dx} = \operatorname{sech} x.$$

Differentials

$$d \sinh x = \cosh x \cdot dx. \qquad d \coth x = -\operatorname{csch}^2 x \cdot dx.$$
$$d \cosh x = \sinh x \cdot dx. \qquad d \operatorname{sech} x = -\operatorname{sech} x \cdot \tanh x \cdot dx.$$
$$d \tanh x = \operatorname{sech}^2 x \cdot dx. \qquad d \operatorname{csch} x = -\operatorname{csch} x \cdot \coth x \cdot dx.$$

$$d \sinh^{-1} x = \frac{dx}{\sqrt{1 + x^2}}. \qquad d \coth^{-1} x = -\frac{dx}{x^2 - 1}.$$

$$d \cosh^{-1} x = \frac{dx}{\sqrt{x^2 - 1}}. \qquad d \operatorname{sech}^{-1} x = -\frac{dx}{x\sqrt{1 - x^2}}.$$

$$d \tanh^{-1} x = \frac{dx}{1 - x^2}. \qquad d \operatorname{csch}^{-1} x = -\frac{dx}{x\sqrt{x^2 + 1}}.$$

Integrals involving the hyperbolic functions will be found in the table of integrals.

ELLIPTIC FUNCTIONS

$$u = F(k, \phi) = \int_0^\phi \frac{d\phi}{\sqrt{1 - k^2 \sin^2 \phi}}, \qquad (k^2 < 1),$$
$$= \text{elliptic integral of the first kind.}$$
$$u = \int_0^x \frac{dx}{\sqrt{(1 - x^2)(1 - k^2x^2)}}, \qquad \text{where } x = \sin \phi.$$

ϕ is called the amplitude of u or am u.
k is called the modulus.

$$k' = \sqrt{1 - k^2} = \text{the complementary modulus.}$$

$\sin \phi = \text{sn } u = x.$ $\qquad \tan \phi = \text{tn } u = \dfrac{x}{\sqrt{1 - x^2}}.$

$\cos \phi = \text{cn } u = \sqrt{1 - x^2}.$ $\qquad \Delta\phi = \text{dn } u = \sqrt{1 - k^2x^2}.$
am $0 = 0.$ $\qquad$ sn $0 = 0.$
cn $0 = 1.$ $\qquad$ dn $0 = 1.$
am $(-u) = -$am $u.$ $\qquad$ sn $(-u) = -$sn $u.$
cn $(-u) =$ cn $u.$ $\qquad$ dn $(-u) =$ dn $u.$
tn $(-u) = -$tn $u.$
$\text{sn}^2 u + \text{cn}^2 u = 1.$
$\text{dn}^2 u + k^2 \text{sn}^2 u = 1.$
$\text{dn}^2 u - k^2 \text{cn}^2 u = 1 - k^2 = k'^2.$

$$E(\phi, k) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \phi}\, d\phi$$
$$= \int_0^x \frac{\sqrt{1 - k^2x^2}}{\sqrt{1 - x^2}}\, dx \qquad \text{where } x = \sin \phi,$$
$$= \text{the elliptic integral of the second kind.}$$

Complete Elliptic Integrals

$$K = \int_0^{\pi/2} \frac{d\phi}{\sqrt{1 - k^2 \sin^2 \phi}}.$$
$$E = \int_0^{\pi/2} \sqrt{1 - k^2 \sin^2 \phi}\, d\phi.$$

THE ELEMENTS

Revised by Harrison Hale

The most striking fact about the elements is their unequal distribution and occurrence. In the earth's crust, including the ocean and the atmosphere, F. W. Clarke reported after careful calculation that oxygen makes up 50% and silicon 25%, the two elements being three-fourths of all matter. Further he concludes that twelve elements form 99% of all this material, leaving only 1% for the other eighty elements. Fully half of the elements are of minor commercial importance at present. No one knows when an element may become of unusual commercial importance. Several theories have been suggested to explain this wide difference in occurrence, but none of these is generally accepted. Of the twelve most common elements only one has an atomic weight of more than 40, iron with 56. The lightness of these common elements is emphasized by the heaviness of twelve or more other elements with atomic weights above 200. And yet by no means are all the light elements common.

Actinium (Gr. *aktis*, *aktinos*, beam or ray), Ac; at. wt. 227 (approx.); at. no. 89. Discovered in 1899 by Andre Debierne and independently by F. Giesel in 1902. Radioactive, decomposing into other elements of smaller atomic weight at certain intervals of time. (See Radioactive Elements.)

***Alabamine** (State of Alabama), Ab; at. wt. 221; at. no. 85; valence 1, 3, 5 or 7. Discovered in 1931 by Dr. Fred Allison and co-workers at Alabama Polytechnic Institute, by the magneto-optic method of analysis. Minima for HAb, HAbO, $HAbO_3$ and $HAbO_4$ were measured. Ab can be oxidized in alkaline solution but more readily in acid solution. The peralabamates are the most stable compounds. (Existence questioned Ed.)

Aluminum (L. *alumen*, alum), Al, at. wt. 26.97; at. no. 13; m.p. 659.7°C; b.p. 1800°C; sp. gr. 2.699 (20°C); valence 3. Wöhler is generally accredited with obtaining the metal in 1827, though an impure form was prepared by Oersted two years earlier. The method of obtaining the metal by electrolysis of pure alumina dissolved in cryolite was patented independently by Hall in the United States and Heroult in France, soon after its discovery in 1886. Although aluminum occurs in larger quantities than any other metal, ranking third among all elements, it does not appear free. It is found as the silicate in clays, feldspars, etc., while the commercial ore at present is bauxite, an impure hydrated oxide. Its production from clay is possible. The metal is white and strongly resists the action of the air, becoming covered with a white oxide coating in time; it was selected as the cap for Washington's monument, and is widely used for outside building decoration. It stands second among metals in the scale of malleability, sixth in ductility. The electrical conductivity is about 60% that of copper per area of cross-section, but aluminum is much lighter, giving it use for transmission lines. It is but slightly magnetic and is strongly electro-positive, so that in contact with many other metals it corrodes rapidly. Its many alloys have strength and lightness, finding increasing use. . The compounds of greatest importance are its oxide, its sulfate, and its double sulfate with potassium

* See element 85 at end of list.

(alum). The oxide, alumina, occurs naturally as ruby, sapphire, corundum and emery, and is very hard, ranking next to the diamond. War's necessity has increased greatly the aluminum produced and this will widely extend its use in time of peace. In 1856 the price was about $90 a pound; thirty years later just before Hall's discovery about $5. Then the price dropped rapidly to 30¢ and has gone as low as 15¢.

* **Antimony** (L. *antimonium*), Sb (L. *stibium*, mark); at. wt. 121.76; at. no. 51; m.p. 630.5°C; b.p. 1380°C; sp. gr. 6.691 (20°C); valence 3 or 5. Recognized in compounds by the ancients; known as a metal at the beginning of the seventeenth century and possibly before that date. Antimony is a metallic element, common, but neither abundant nor widely diffused; sometimes found native, but more frequently as the sulfide, *stibnite* (Sb_2S_3); also as antimonides and sulfantimonides of the heavy metals, and as oxides. It is extracted from the sulfide by roasting to the oxide, which is reduced by salt and scrap iron; from its oxides it is also prepared by reduction with carbon. Antimony is an extremely brittle metal of a flaky, crystalline texture, blue-white color and metallic luster; hardness, 3 to 3.5; not acted on by air at room temperature, but burns brilliantly when heated with formation of white fumes of oxide Sb_2O_3. It is a poor conductor of heat and electricity. Important alloys include type metal and friction reducing metals. The principal compounds are the sulfides, chlorides, and tartar emetic (hydrated potassium antimonyl tartrate).

Argon (Gr. *argon*, inactive), A; at. wt. 39.944; at. no. 18; m.p. −189.2°C; b.p. −185.7°C; density 1.78394 g/l; valence 0 (does not combine with any other element). Its presence in air was suspected by Cavendish in 1785; discovered by Lord Rayleigh and Sir William Ramsay in 1894. The gas is prepared by fractionation of liquid air, the atmosphere containing 0.94% argon. It is 2½ times as soluble in water as nitrogen, having about the same solubility as oxygen; best recognized by the characteristic lines in the red end of the spectrum. It is used in electric light bulbs and in fluorescent tubes at a pressure of about 3 mm.

Arsenic (L. *arsenicum*, Gr. *arsenikon*, yellow orpiment—identified with *arsenikos*, male, from the belief that metals were of different sexes—Arab. *az-zernikh*, the orpiment from Persian *zerni-zar*. gold-), As; at. wt. 74.91; at. no. 33; m.p. sublimes (500°C m.p. under pressure); b.p. 615°C; sp. gr. 5.73; valence 3 or 5. The amorphous form of arsenic has a sp. gr. of 3.70. It is believed that Albertus Magnus obtained the element in 1250. In 1649 Schroeder published two methods of preparing it. Found native, in sulfides, *realgar* and *orpiment*, as arsenides and sulfarsenides of heavy metals and as oxide, and arsenate. *Mispickel* or arsenopyrite (FeSAs) is the most common mineral, from which on heating the arsenic sublimes leaving ferrous sulfide. The element is a steel gray, very brittle, crystalline, semi-metallic solid, which sublimes on heating, being deposited partly as crystals and partly as a black, amorphous solid; it tarnishes in air and when heated is rapidly oxidized to arsenous

* Americium, see end of list

oxide (As_2O_3) with the odor of garlic. Though the free element is not considered poisonous, many of its compounds are extremely so, being used as insecticides. Arsenic is also used in bronzing pyrotechny, and for hardening and improving the sphericity of shot. The most important compounds are white arsenic (As_2O_3), the sulfide, Paris green ($CuHAsO_3$), calcium arsenate and lead arsenate, the last three being used in agricultural poisons. Marsh's test makes use of the formation and ready decomposition of arsine (AsH_3). Important war gases as Adamsite and Lewisite, are compounds of arsenic.

Barium (Gr. *barys*, heavy), Ba; at. wt. 137.36; at. no. 56; m.p. 850°C; b.p. 1140°C; sp. gr. 3.5 (20°C); valence 2. Baryta was distinguished from lime by Scheele in 1774; the element was discovered by Sir Humphry Davy in 1808. It is found only in combination with other elements chiefly in *barite* or *heavy spar* (sulfate) and *witherite* (carbonate) and is prepared by electrolysis of the chloride. Barium is a metallic element, soft and silvery white like lead; it belongs to the alkaline earth group, resembling calcium chemically. The most important compounds are the peroxide (BaO_2), chloride, sulfate, carbonate, nitrate and chlorate. The sulfate, as permanent white or *blanc fixé*, is used in paint, the carbonate as a rat poison, while the nitrate and chlorate give green colors in pyrotechny. The sulfide phosphoresces after exposure to the light. The compounds are not expensive and the metal is not in great demand.

Beryllium (L. fr. *beryl;* also called *Glucinum*, Gr. *glykys*, sweet), Be; at. wt. 9.02; at. no. 4; m.p. 1350°C; b.p. 1500°C (5 mm.) sp. gr. 1.8 (20°C); valence 2. Discovered as the oxide by Vauquelin in beryl and in emerald in 1798; the metal was isolated in 1828 by Wohler and by Bussy independently. Beryllium aluminum silicates are the chief sources of the metal today. It is prepared by electrolysis of the double fluoride, K_2BeF_4. Hard enough to scratch glass, the metal resembles magnesium in appearance and chemical properties. Its soluble compounds are sweet. Its alloys are strong, light and resistant to corrosion. The metal is widely found, but in only small quantities of ore. The use in light alloys is increasing with the decrease in price of the metal. Addition of small amounts brings to the alloy much higher fatigue endurance.

Bismuth (Ger. *Weisse Masse*, white mass; later *Wismuth*). Bi; at. wt. 209.00; at. no. 83; m.p. 271.3°C; b. p. 1450°C; sp. gr, 9.78 (20°C); valence 3 or 5. In early times bismuth was confused with tin and lead. Claude Geoffroy showed it to be distinct from lead in 1753. It is a white, crystalline, brittle metal with a pinkish tinge. It occurs native, but the common ore is the sulfide, *bismuthinite;* from this it is extracted by melting out the free metal, the oxides and sulfides being decomposed by the addition of carbon and iron. It is also recovered as a by-product in lead smelting. Bismuth is a poor conductor of electricity, is very diamagnetic, solidifies with expansion, heated in air it burns with a blue flame forming yellow fumes of the oxide. It forms many alloys with metals, which are often used for their property of low melting (fusible metals) and because of

their expansion on cooling, making them particularly suited for sharp castings of objects subject to damage by high temperatures. Its soluble salts are characterized by forming insoluble basic salts on the addition of water—a property sometimes used in detection. The important compounds are the trioxides and the subnitrates of medicinal use, (*pearl white*, *pearl powder*, *blanc de fard* and *blanc d'Espagne*).

Boron (Ar. *būraq*, Pers. *būrah*), B; at. wt. 10.82; at. no. 5; m.p. 2300°C; b.p. sublimes 2550°C; sp. gr. of crystals 2.54, of amorphous variety 2.45; valence 3. Discovered in 1808 by Sir Humphry Davy and by Gay-Lussac and Thenard. The element is not found free in nature, but occurs as orthoboric acid usually in certain volcanic spring waters and as borates in *borax* and *colemanite*. Boron is obtained by heating the trioxide with magnesium powder, and has little or no commercial value. The most important compounds are boric, or boracic, acid widely used as a mild antiseptic, and borax ($Na_2 B_4 O_7.10H_2O$), which serves as a cleansing flux in welding and as a water softener in washing powders.

Bromine (Gr. *bromos*, stench), Br; at. wt. 79.916; at. no. 35; m.p. −7.2°C; b.p. 58.78°C; density of gas 7.59 g/l, liquid 3.12 (20°C); valence 1, 3, 5, or 7. Discovered by Balard in 1826, but not prepared in quantity until 1860. A member of the halogen group of elements, it is obtained from natural brines from wells in Michigan and West Virginia and from sea water by displacement with chlorine; electrolysis might be used. Bromine is the only liquid non-metallic element. It is a heavy, mobile, reddish-brown liquid, volatilizing readily at room temperature to a red vapor with a strong disagreeable odor, resembling chlorine, and having a very irritating effect on the eyes and throat; it is readily soluble in water or carbon disulfide, forming a red solution; it is less active than chlorine but more so than iodine; it unites readily with many elements and has a bleaching action; when spilled on the skin it produces painful sores. It is chiefly employed for the preparation of its compounds, which are useful in photography, medicine, coal tar derivatives, and as ethylene bromide in anti-knock gasoline. Organic compounds are important.

Cadmium (Gr. *kadmia*, earth), Cd; at. wt. 112.41; at. no. 48; m.p. 320.9°C; b.p. 767°C; sp. gr. 8.65 (20°C); valence 2. Discovered by Stromeyer in 1817 from an impurity in zinc carbonate. Cadmium occurs in small quantities associated with zinc. It comes off before zinc in the preparation of the metal, condensing as the brown oxide, which is then reduced with carbon. It tarnishes in air and burns when heated, forming the oxide. It is a soft, bluish-white metal, used in standard cells for the accurate determination of E.M.F. The use of the metal industrially has increased greatly; it is a component of one of the lowest melting alloys; it is extensively used in bearing alloys with low coefficients of friction and great resistance to fatigue; it is used in electroplating. It forms a number of salts of which the sulfate is the most common; the sulfide is used as a yellow pigment.

Calcium (L. *calx*, lime), Ca; at. wt. 40.08; at. no. 20; m.p. 810°C; b.p. 1170°C; sp. gr. 1.55 (20°C); valence 2. Though lime was prepared by the Romans in the first century under the name calx, not until 1808 was the metal discovered by Davy and by Berzelius and Pontin independently by preparation of an amalgam electrolytically and removal of the mercury by distillation. Calcium is a metallic element, fifth in abundance in the earth's crust, of which it forms more than three per cent; an essential constituent of leaves, bones, teeth and shells. Never found in nature uncombined, it occurs abundantly as *limestone* ($CaCO_3$), *gypsum* ($CaSO_4.2H_2O$) and fluorite (CaF_2); *apatite* is the fluophosphate or chlorophosphate of calcium. It is prepared by electrolysis of the fused chloride; chemically it is one of the alkaline earth elements; it readily forms a white coating of oxide in the air, reacts with water, burns with a yellow red flame to the oxide. Its natural and prepared compounds are widely used. Quick lime (CaO) made by heating limestone and changed into slaked lime by the careful addition of water is the great cheap base of chemical industry with countless uses. Mixed with sand it hardens as mortar and plaster by taking up carbon dioxide from the air. The solubility of the carbonate in water containing carbon dioxide causes the formation of caves with stalactites and stalagmites and hardness in water. Other important compounds are the carbide (CaC_2), chloride ($CaCl_2$), cyanamide $CaCN_2$) hypochlorite ($Ca(OCl)_2$), nitrate $Ca(NO_3)_2$, and sulfide (CaS).

Carbon (L. *carbo*, charcoal), C; at. wt. 12.010; at. no. 6; m.p. sublimes above 3500°C; b.p. 4200°C; sp. gr. amorphous 1.88, graphite 2.25, diamond 3.51; valence 2, 3 or 4. Carbon, an element of prehistoric discovery and characteristic of organic matter, is very widely distributed in nature, occurring free as diamond and graphite. In combination it is found as carbon dioxide in the atmosphere and dissolved in all natural waters, as great rock masses composed of carbonates of calcium, magnesium and iron, as hydrocarbons in supplies of petroleum and natural gas. Coal consists chiefly of carbon compounds. It appears in three allotropic forms, diamond, graphite and amorphous, all solids, insoluble in any common solvent but dissolving in melted metals from which it crystallizes on cooling in the form of graphite; when the cooling takes place under pressure some of the carbon is obtained as diamond. Carbon is unique is forming an almost infinite number of compounds, often linking carbon atom to carbon atom, there being at present half a million known compounds. Some of the most important compounds are carbon dioxide, carbon monoxide, carbon disulfide, chloroform ($CHCl_3$), carbon tetrachloride (CCl_4), methane (CH_4), ethylene (C_2H_4), acetylene (C_2H_2), benzene (C_6H_6), ethyl alcohol (C_2H_5OH), acetic acid (CH_3COOH) and countless derivatives.

Cerium (named for the planetoid *Ceres*, which was discovered in 1801 only two years before the element), Ce; at. wt. 140.13; at. no. 58; m.p. 640°C; b.p. 1400°C; sp. gr. 6.90 (20°C); valence 3 or 4. Discovered in 1803 by Klaproth and by Berzelius and

Hisinger; metal prepared by Hillebrand and Norton in 1875. Cerium is the most abundant of the metals from the so-called rare earths; it is found in a number of minerals including *orthite*, *cerite* and *samarskite* of North Carolina. Prepared by the electrolysis of the chloride it is a steel-gray lustrous metal; used as a pyrophoric alloy with iron, it gives off showers of sparks when struck. As the oxide it is an important constituent of incandescent gas mantles; as ceric sulfate it finds extensive use as a volumetric oxidizing agent in quantitative analysis.

Cesium (L. *caesius*, sky blue), Cs; at. wt. 132.91; at. no. 55; m.p. 28.5°C; b.p. 670°C; sp. gr. 1.873 (20°C); valence 1. The first metal discovered by Bunsen and Kirchhoff with the spectroscope. This was in 1860, the source being a mineral water from Dürkheim. Cesium is an alkali metal occurring in *lepidolite*, *pollucite* (a hydrated silicate of aluminum and cesium) and in the water from certain mineral springs; it is isolated by electrolysis of the fused cyanide. The metal is characterized by a spectrum containing two bright lines in the blue along with several others in the red, yellow and green. Because of its great affinity for oxygen the metal is used as a "getter" in radio tubes. It is also used in photo-electric cells, as well as for a catalyst in the hydrogenation of certain organic compounds. Its chief compounds are the chloride and the nitrate.

Chlorine (Gr. *chloros*, greenish-yellow), Cl; at. wt. 35.457; at. no. 17; m.p. −101.6°C; b.p. −34.6°C; density 3.214 g/l; sp. gr. 1.56 (−33.6°C); valence 1, 3, 5 or 7. Discovered in 1774 by Scheele, who thought it contained oxygen; named in 1810 by Davy, who insisted it was an element. In nature it is found in the combined state only, chiefly with sodium as common salt ($NaCl$), *carnallite* ($KMgCl_3.6H_2O$), and *sylvite* (KCl). A member of the halogen (salt forming) group of elements it is obtained from chlorides by the action of oxidizing agents and more often by electrolysis; it is a greenish-yellow gas, with an irritating and suffocating odor, attacking the respiratory tract; combines directly with nearly all elements. At 10°C one volume of water dissolves 3.10 volumes of chlorine, at 30° only 1.77 volumes. Being a heavy gas, it was first used as a war gas by the Germans in 1915; most war gases contain chlorine. Berthollet suggested its use for bleaching, a most important reagent for vegetable fibers to-day. Around the globe it is used as a germicide in drinking water; further use is in the manufacture of bleaching powder, hypochlorites and chlorates, chloroform, carbon tetrachloride and in the extraction of bromine. Organic chemistry demands much both as an oxidizing agent and in substitution, since it often brings desired properties in an organic compound when substituted for hydrogen, as in one form of synthetic rubber.

Chromium (Gr. *chroma*, color), Cr; at. wt. 52.01; at. no. 24; m.p. 1615°C; b.p. 2200°C; sp. gr 7.1 (20°C); valence 2, 3, or 6. Discovered in 1797 by Vauquelin, who prepared the metal the next year. Chromium is a metallic element, resembling iron, occurring chiefly in chrome iron ore ($FeO.Cr_2O_3$); prepared by the reduction of the oxide with aluminum; it is a very infusible,

hard gray metal, used to harden steel, to manufacture stainless steel and in many very useful alloys. Much is used in plating, giving a hard, beautiful surface. All compounds of chromium are colored; the most important are the chromates of sodium and potassium (K_2CrO_4) and the dichromates ($K_2Cr_2O_7$) and the potassium and ammonium chrome alums $KCr(SO_4)_2.12H_2O$. The dichromates are used as oxidizing agents in quantitative analysis, also in tanning leather. Other compounds are of industrial value; lead chromate is chrome yellow, a valued pigment.

Cobalt (*kobold*, from the Greek, goblin or evil spirit), Co; at. wt. 58.94; at. no. 27; m.p. 1480°C; b.p. 3000°C; sp. gr. 8.9 (20°C); valence 2 or 3. Discovered by Brandt in 1735. Cobalt is a metal occurring in ores sparingly distributed, usually sulfide or arsenide. It is prepared by reducing the oxide with aluminum; it is brittle, hard, very magnetic, and of a gray color with a reddish tinge. Its alloys are important, as stainless steel, it is used in electroplating because of its appearance, hardness and resistance. The salts have been used for centuries for the production of brilliant and permanent blue colors in porcelain, glass, pottery, tiles and enamels, being the principal ingredient in *Sevres blue* and *Thenard's blue*. As little as 0.1% of the metal gives an intense blue color. A solution of the chloride ($CoCl_2$.-$6H_2O$) is used as sympathetic ink, the solution being pink and practically colorless when spread on paper, turns blue on heating which removes the water of crystallization. The cobalt ammines are of interest; the oxide and the nitrate are important.

Columbium (*Columbia*, also called Niobium), Cb (or Nb); at. wt. 92.91; at. no. 41; m.p. 1950°C; b.p. 2900°C; sp. gr. 8.4 (20°C); valence 3 or 5. Discovered in 1801 by Hatchett in an ore sent to England more than a century before by John Winthrop, first governor of Connecticut. Metal prepared by Blomstrand, who reduced the chloride by heating in hydrogen in 1864. Columbium is a rare metallic element, found as *columbite* in pegmatite veins, volcanic intrusions through the earth's crust. Added to stainless steel this metal by combining with carbon preserves the corrosion resistance even when heated. This use has greatly increased the demand for the metal now obtained from an African ore. After removing tin from this ore, the residue is reduced with silicon or aluminum in an electric furnace, giving ferro-columbium, suited to steel making. The metal is gray; it forms an acid oxide, Cb_2O_5, from which salts are derived.

Copper (L. *cuprum*, from the island of Cyprus), Cu; at. wt. 63.57; at. no. 29; m.p. 1083°C; b.p. 2300°C; sp. gr. 8.93–8.95; valence 1 or 2. The discovery of copper dates from prehistoric times; it is said to have been mined for more than 5000 years. Copper is a metallic element, reddish colored, bright, metallic luster, malleable, ductile, a good conductor of heat and electricity (second only to silver in electrical conductivity). It occurs native and in many minerals; the most important of these compounds are sulfides, oxides and carbonates. From these it is obtained by smelting, leaching or electrolysis. Its alloys, brass

and bronze, long used are still most important; all American coins are copper alloys; monel and gun metals also contain copper. The most important compounds are the oxide and the sulfate, blue vitriol; the latter has wide use as an agricultural poison and as an algicide in water purification. Copper compounds are widely used in analytical chemistry, as Fehling's solution in tests for sugar.

***Deuterium,** an isotope of hydrogen—see later paragraph.

Dysprosium (Gr. *dysprositos*, hard to get at), Dy; at. wt. 162.46; at. no. 66; m.p. . . . . . ; b.p. . . . ; sp. gr. . . . ; valence 3. Discovered in 1886 by Lecoq de Boisbaudran. The so-called rare earths may be divided into two groups, the cerium and the yttrium. Dysprosium is in the latter group, a member of the erbium family, closely related to holmium. It occurs in the minerals usually found in granite or in pegmatite veins, such as *xenotime*, *fergusonite*, *gadolinite*, *euxonite*, *polycrase* and *blomstrandine*. The free element has never been isolated; its salts are highly colored.

Erbium (Ytterby, a town in Sweden), Er; at. wt. 167.2; at. no. 68; m.p. . . . . . ; b.p. . . . . . ; sp. gr. 4.77 (?); valence 3. Discovered in 1843 by Mosander. Erbium is in the yttrium group of rare earth metals with atomic numbers of 64 to 71 in addition to yttrium, 39. In order of increasing basicity are included thulium, erbium, holmium and dysprosium, with decreasing atomic weights. Erbium occurs in the minerals mentioned under dysprosium above. It forms an oxide Er_2O_3 and highly colored salts.

Europium (Europe), Eu; at. wt. 152.0; at. no. 63; m.p. . . . . ; b.p. . . . . . ; sp. gr. . . . . . ; valence 2 or 3. Discovered in 1901 by Demarcay. Europium is in the cerium group with atomic numbers from 57 to 63 and related in order of discovery. It is very sparsely distributed and of slight importance at present. Salts of the type EuX_3 and EuX_2, where X is a univalent atom or radical, are known.

Fluorine (L. *fluo*, flow), F; at. wt. 19.000; at. no. 9; m.p. −223°C; b.p. −187°C; density 1.69 g/l (15°C); sp. gr. of liquid 1.11 (−187°C); valence 1. Discovered by Scheele in 1771, but not isolated until 1886, by Moissan. It occurs chiefly in *fluor spar* (CaF_2) and *cryolite* (Na_3AlF_6), but seems rather widely distributed. Fluorine, a member of the halogen family of elements, is obtained by electrolyzing a solution of potassium hydrogen fluoride in anhydrous hydrogen fluoride in a vessel of metal or transparent fluorspar. It is a pale yellow gas, uniting directly with silicon, carbon, hydrogen and nearly all other elements in the dark; decomposes almost all compounds to form fluorides. The most important compounds are hydrogen fluoride, which is used in etching glass, and calcium fluoride. Freeon, used in air conditioning, is difluoro di chloro methane. Both the element and hydrofluoric acid are dangerous poisons. The presence of fluorides in drinking water to the extent of two parts per million, or less, causes mottled enamel in teeth, when used by children acquiring permanent teeth. Organic compounds of fluorine are now receiving attention.

* Curium, see end of list.

Gadolinium (*gadolinite*, name for Gadolin, a chemist of Finland), Gd; at. wt. 156.9; at. no. 64; m.p. . . . ; b.p. . . . . ; sp. gr. . . . . . ; valence 3. Separated by Marignac in 1880 and by Lecoq de Boisbaudran in 1886. In order of discovery gadolinium belongs in the yttrium group, being a member of the terbium family. It is named for the mineral from which the earth was obtained. The free element has never been isolated; the element forms oxides of the type R_2O_3, and its salts are usually more soluble than the corresponding terbium salts; its compounds are more plentiful than those of terbium or of europium. These elements decrease in order of basicity, Eu, Gd, Tb.

Gallium (L. *Gallia*, France), Ga; at. wt. 69.72; at. no. 31; m.p. 29.75°C; b.p. 1600°C; sp. gr. 5.91 (20°C); valence 2 or 3. Discovered spectroscopically by Lecoq de Boisbaudran in 1875, who in the same year obtained the free metal by electrolysis of a solution of the hydroxide in potassium hydroxide. A very rare metal, whose salts resemble those of aluminum; found in traces in many zinc blendes and nearly always in bauxite. Gallium was discovered in zinc blende from a mine in Hautes-Pyrenees; had been predicted and described as eka-aluminum by Mendeleeff. Besides mercury, cesium and rubidium, gallium is the only metal which can be liquid at near room temperatures; this makes possible its use in high temperature thermometers; the solid is hard and grayish-white. The metal forms two sets of oxides and salts in which it has a valence of two or of three.

Germanium (L. *Germania*, Germany), Ge; at. wt. 72.60; at. no. 32; m.p. 958.5°C; b.p. volatilizes at 2700°C; sp. gr. 5.36 (20°C); valence 4. Discovered by Winkler in 1886; had been predicted and described as eka-silicon by Mendeleeff. The metal is prepared by reducing the oxide with carbon or with hydrogen. The oxide was first obtained from *argyrodite*, a sulfide of germanium and silver; in 1916 the mineral, *germanite*, containing 8% of germanium was discovered. Being in the silicon group, the metal lies between silicon and tin in physical and chemical properties; it is a gray-white, brittle, crystalline metal, retaining its luster in air at room temperatures. The most important compounds are the oxide GeO_2, and the halides, as $GeCl_4$, which is volatile.

Glucinum—see *Beryllium*.

Gold (Sanskrit *Jval;* Anglo-Saxon *gold*), Au (L. *aurum*, shining dawn); at. wt. 197 2; at. no. 79; m.p. 1063°C; b.p. 2600°C; sp. gr. 19.32 (17.5C); valence 1 or 3. Known and highly valued from earliest times. Gold is found in nature as the free metal and in tellurides; very widely distributed but almost always associated with quartz or pyrite; occurs in veins and in alluvial deposits. The metal is obtained from its ores by cyanidation, amalgamation and smelting. Refining is frequently done by electrolysis. It has been estimated that all the gold in the world could be placed in a single cube, forty feet on the side. As with most metals, recent production has greatly increased. Gold is a metallic element, having a yellow color when in mass, but when finely divided it may be black,

ruby or purple; colloidal gold has been used to color ruby cathedral glass windows. It is the most malleable and ductile, and also one of the softest of the metals; it is a good conductor of heat and electricity and is not affected by air and most reagents. Its chief use is in coinage and jewelry, when it is alloyed with other metals, pure gold being expressed as 24 carat. When used as a standard of value by the United States, one Troy ounce was worth $20.67 plus; since 1934 this value has been fixed by law and the President's order at $35.00 per ounce. The commonest compounds are auric chloride ($AuCl_3$) and chlorauric acid ($HAuCl_4$), the latter being used in photography for toning the silver image. A mixture of one part of nitric acid with three of hydrochloric acid is called *aqua regia*, because it dissolves Gold, the King of Metals.

Hafnium (*Hafnia*, Copenhagen), Hf; at. wt. 178.6; at. no. 72; m.p. 1700°C; b.p. above 3200°C; sp. gr. 13.3; valence 4. Discovered in 1923 by D. Coster and G. von Hevesy in a *zircon* from Norway by means of Röntgen spectroscopic analysis. On the basis of the Bohr theory the new element was expected to be associated with zirconium. On treatment of the mineral with potassium bifluoride and separation K_2ZrF_6, the mother liquors became richer in the new element. All the zirconium minerals examined except one contained hafnium. It has been separated from zirconia by repeated recrystallization of the double ammonium or potassium fluorides. Metallic hafnium was prepared by passing the vapor of the tetraiodide over a heated tungsten filament; this was done by van Arkel and deBoer; it has the same crystalline structure as zirconium. Hafnium also resembles zirconium in chemical properties. There is an oxide (HfO_2), a white powder, with corresponding hydroxide and salts.

Helium (Gr. *helios*, the sun), He; at. wt. 4.003; at. no. 2; m.p. below −272.2°C (26 atm.); b.p. −268.9°C; density 0.177 g/l; valence 0. Evidence of the existence of helium was first obtained by Janssen during the eclipse of 1868, when he detected a new line in the solar spectrum; Lockyer and Frankland suggested the name for the new element; in 1895 Ramsay isolated helium from *uraninite*. Helium is a gas, inert chemically, obtained by compression and fractionation of the gas from certain wells and from many radioactive minerals. Onnes has cooled the element to the lowest temperature ever obtained, −272.918°C, and expressed the opinion that helium may remain a liquid even at absolute zero under normal pressure. In 1926 Keesom solidified it under a pressure of 26 atmospheres. Approximately twice as heavy as hydrogen it is used for inflating balloons because it will not burn. A mixture of 80% helium and 20% oxygen is used as an artificial atmosphere for divers and others working under pressure; since helium is less soluble in the blood than nitrogen it does not produce the "bends."

Holmium (L. *Holmia*, for Stockholm), Ho; at. wt. 164.94; at. no. 67; m.p. . . . . . ; b.p. . . . . ; sp. gr. . . . . . ; valence 3. Discovered by Cleve while working on erbia earth in 1879; pure holmia earth was isolated by Homberg in 1911. Holmium is in the yttrium group of rare earth metals in order of

discovery; it is a member of the erbium family, which includes thulium, erbium, holmium, dysprosium in the order of increasing basicity. It occurs in gadolinite and similar minerals. The element has not been isolated, but the oxide (Ho_2O_3), a grayish-white powder, and corresponding salts have been prepared.

Hydrogen (Gr *hydro*, water, and *genes*, forming), H; at. wt. 1.0080; at. no. 1; m.p. −259.14°C; b.p. −252.7°C, density 0.08988 g/l; sp. gr. liquid 0.070 (−252°C); valence 1. First recognized as a distinct substance by Cavendish in 1766; named by Lavoisier. Hydrogen occurs chiefly in combination with oxygen as water; also in acids, bases and alcohols as well as in carbohydrates, in petroleum and other hydrocarbons. It is usually a constituent of organic compounds, especially those used as fuels and as food. It is the lightest of all gases, insoluble in water, uniting with many elements to form compounds; it is used as a reducing agent, as a means of obtaining high temperature flames, in atomic hydrogen welding and for inflating balloons. Great quantities are required commercially for the fixation of nitrogen from the air in the Haber ammonia process and for the hydrogenation of fats and oils. It is prepared by action of steam on heated carbon, by the electrolysis of water, or by the displacement from acids by certain metals. In 1932 Urey announced the preparation of the isotope with an atomic weight of 2, commonly called deuterium; tritium with an atomic weight of 3 was discovered two years later. One part of deuterium is found to about 5000 ordinary hydrogen atoms; with tritium the ratio is only one to a billion.

***Illinium** (University and State of Illinois), Il; at. wt. estimated 146; at. no. 61; m.p. . . . . ; b.p. . . . . . ; sp. gr. . . . . ; valence doubtless 3. The discovery of illinium was announced in 1926 by Hopkins, Yntema and Harris on the basis of absorption, arc, and X-ray emission spectra. Later in the same year Rolla and Fernandez in Italy claimed prior discovery and proposed the name florentium. The late Charles James at the University of New Hampshire concentrated considerable illinium and other investigators have since confirmed the existence of the element in this material. Hopkins used material obtained from monazite sand. Illinium is a member of the cerium group of rare earth metals which includes lanthanum, cerium, praseodymium, neodymium, illinium and samamrium in order of decreasing basicity. Neither the metal nor its salts have been prepared in an entirely pure state.

Indium (from its indigo blue spectrum), In; at. wt. 114.76; at. no. 49; m.p. 155°C; b.p. 1450°C; sp. gr. 7.28 (20°C); valence 1 or 3. Discovered in 1863 by the use of the spectroscope by Reich and Richter, who later isolated the metal. Indium is a rare metallic element, occurring usually in zinc blendes, sometimes with pyrites and siderite. The metal is obtained by electrolysis from baths of complex cyanide, chloride and sulfate. It belongs to the aluminum group in properties, being a very soft, silvery metal, not acted on by water or air, burning to the oxide (In_2O_3). Electroplates of indium increase the resist-

* See element 61 at end of list.

ance of certain bearing alloys to organic acid corrosion. The metal finds use in alloys for jewelry and in dental alloys.

Iodine (Gr. *iodes*, violet), I; at. wt. 126.92, at. no. 53; m.p. 113.5°C; b.p. 184.35°; density of the gas 11.27 g/l; sp gr. solid 4.93 (20°C); valence 1, 3, 5, or 7. Discovered by Courtois in 1811. Iodine, a halogen, occurs sparingly in the form of iodides in sea water from which it is assimilated by seaweeds, in Chile saltpeter, in brines from old sea deposits and in caliche (as sodium iodate); from iodides it is obtained on treatment with sulfuric acid and some oxidizing agent (MnO_2) and from the iodates by heating with sodium bisulfite; for about ten years it has been obtained from brines from salt wells by a new process using finely divided silver, which has so increased production that the price has been reduced to about one-third. It is a grayish-black, lustrous solid, volatilizing at ordinary temperatures into a blue-violet gas with an irritating odor; it forms compounds with many elements, but is less active than the other halogens, which displace it from iodides. It dissolves slightly in water, readily in chloroform, carbon tetrachloride or carbon disulfide to beautiful purple solutions. Iodine compounds are important in organic chemistry. The most common compounds are the iodides of sodium and potassium (KI) and the iodates (KIO_3). Lack of iodine is the cause of goiter The iodide and thyroxin, which contains iodine, are used internally in medicine, and a solution of iodine in alcohol for external wounds. Potassium iodide finds some use in photography. The deep blue color with starch solution is characteristic of the free element.

Iridium (L. *iris*, rainbow), Ir; at. wt. 193.1; at. no. 77; m.p. 2350°C; b.p. above 4800°C; sp. gr. 22.42 (17°C); valence 3 or 4. Discovered in 1803 by Tennant in the residue left when crude platinum is dissolved by aqua regia. The name shows the colors of its salts—green, red, violet. Iridium, a metal of the platinum family, is white, very hard and brittle. It occurs uncombined with platinum and other metals of this family in alluvial deposits. It is used in apparatus for high temperatures; alloyed with platinum for standard weights and measures; alloyed with osmium in tipping pens and compass bearings. Iridium black, prepared by exposing alcoholic solutions of the sulfate to light, is used as a catalytic agent. The most important salt is $IrCl_4$.

Iron (Anglo-Saxon, *iron*), Fe (L. *ferrum*); at. wt. 55.85; at. no. 26; m.p. 1535°C; b.p. 3000°C; sp. gr. 7.85–7.88 (20°C); valence 2, 3, or 6. Iron implements are said to have been made by the Egyptians 3000 B.C. The most common ore is *hematite* (Fe_2O_3), from which the metal is obtained by reduction with carbon. Iron is the most abundantly produced of the metals, though aluminum occurs in larger percentage in the earth's crust than iron. The pure metal, which is practically unknown in industry (although some grades of soft steel have a very high percentage of iron), is silver-white, very ductile and magnetic; the pure metal may be prepared by electrolytic deposition from ferrous sulfate, or by reduction of the pure oxide with hydrogen

or aluminum. Pig iron is hard, brittle and fairly fusible, containing about 3% carbon and varying amounts of sulfur, silicon, manganese and phosphorus; wrought iron is tough, grayish-white and malleable, having usually a fibrous structure, very infusible, with only a few tenths per cent or less of carbon; steel is a solid solution of iron carbide in iron with a carbon content usually below 2%. Iron is the cheapest metal known, pig iron usually costing less than a cent a pound and steel about twice as much. Alloying with other metals has greatly improved the properties and widened the use of steel.

Krypton (Gr. *kryptos*, hidden), Kr; at. wt. 83.7; at. no. 36; m.p. −157°C; b.p. −152.9°C; density 3.708 g/l (0°C); valence 0. Discovered in 1898 by Ramsay and Travers in the residue left after liquid air had nearly boiled away. There is one part of krypton in a million parts of air; it is an inert, rare, gaseous element, and is characterized by brilliant green and yellow lines in its spectrum.

Lanthanum (Gr. *lanthano*, to conceal), La; at. wt. 138.92; at. no. 57; m.p. 826°C; b.p. 1800°C; sp. gr. 6.155; valence 3. Occurs in the cerium group of the rare earth metals, lanthana being separated from ceria by Mosander in 1839. It is found in ores *cerite*, *orthite* and *monazite*. The metal is prepared from the chloride by treatment with sodium, or by electrolysis of a fused bath of lanthanum and potassium chlorides and calcium fluoride. Lanthanum resembles iron in its physical properties, burning brilliantly in the air to form La_2O_3.

Lead (Anglo-Saxon *lead*), Pb (L. *plumbum*); at. wt. 207.21; at. no. 82; m.p. 327.4°C; b.p. 1620°C; sp. gr. 11.35 (20°C); valence 2 or 4. Long known; mentioned in Exodus. Lead is obtained chiefly from galena (PbS) by a roasting process. It is a bluish-white metal of bright luster, very soft, highly malleable; has slight tenacity, is ductile and a poor conductor of electricity; lasts very long, since lead pipes bearing the insignia of Roman emperors, used as drains from the baths, are still in service. It is also used as containers for corrosive liquids, as in sulfuric acid chambers; it may be toughened by the addition of a small percentage of antimony or other metal. Its alloys include solder, type metal and various antifriction metals. Great weights of lead both as the metal and as the dioxide are used in storage batteries. White lead, the basic lead carbonate, sublimed white lead ($PbSO_4$), chrome yellow ($PbCrO_4$), red lead (Pb_3O_4) and other lead compounds are extensively used in paints. The nitrate and the acetate are soluble salts. Lead salts are used in medicine, as antiseptics and astringents. Care must be used in both medicine and industry as lead is a cumulative poison.

Lithium (Gr. *lithos*, stone), Li; at. wt. 6.940; at. no. 3; m.p. 186°C; b.p. above 1220°C; sp. gr. 0.534 (20°C); valence 1. Discovered by Arfvedson in 1817. Lithium is the lightest alkali metal; never found free in nature, traces of it occur in nearly all igneous rocks and in the waters of many mineral springs. *Lepidolite*, *spodumene*, *petalite* and *amblygonite* are the more important minerals containing it. The metal is pro-

duced from the fused chloride electrolytically. It is the lightest metal known, soft and white; burned in air it forms Li_2O; its salts are analogous to those of sodium and potassium. The carbonate and citrate are used in medicine to remove uric acid from the body, since lithium urate is soluble. To a limited extent the metal is used industrially in various alloys increasing tensile strength and resistance to corrosion. In the flame test for lithium a brilliant crimson is given.

Lutecium (*Lutetia*, ancient name of Paris—sometimes called cassiopeium by the Germans), Lu; at. wt. 174.99; at. no. 71; m.p. . . . . ; b.p. . . . . . . ; sp. gr. . . . . . . ; valence 3 or 4. In 1907 Urbain and in 1908 von Welsbach described a process by which Marignac's ytterbium (1879) could be separated into the two elements, ytterbium (neoytterbium) and lutecium. Both elements occur in very small amounts in nearly all minerals containing yttrium. Charles James of New Hampshire prepared lutecia independently. This rare earth has little practical use. The oxide, chloride and sulfate have been prepared.

Magnesium (Magnesia, district in Thessaly), Mg; at. wt. 24.32; at. no. 12; m.p. 651°C; b.p. 1110°C; sp. gr. 1.74 (20°C); valence 2. Compounds long known, recognized by Black as an element in 1755, isolated by Davy in 1808, prepared in coherent form by Bussy in 1831. Magnesium is one of the most abundant metals and the eighth element in estimated amount in the earth's crust. It does not occur uncombined but many carbonates and silicates contain considerable percentages, while soluble sulfate and chloride are found in mineral springs and in the ocean. It has been obtained by the electrolysis of the fused chloride; this method has been used for commercial production in the U.S. since 1916, using brines from wells and recently sea water from the Gulf of Mexico also. Electrothermic methods have also been proposed, being difficult because the metal combines when heated both with oxygen and with nitrogen. Recognition of its importance in war caused the one producing company in the U.S. in 1939 to expand its productive capacity six fold. By government direction this was expected to be increased ten times, raising an annual production of six to 400 million tons. It is a light, white and fairly tough metal; tarnishes slightly in air, and as ribbon, wire or powder ignites on heating, burning with a dazzling white flame. It is useful in flash-light photography, flares and for pyrotechnics, including incendiary bombs. It is one-third lighter than aluminum and in its alloys is essential for airplane construction. The first metallic magnesium produced commercially sold for $10 a pound; the price is now less than 30¢. Important compounds are the oxide, chloride, sulfate and citrate, which find use in medicine. In Grignard's reaction, organic magnesium compounds are useful.

Manganese (L. *magnes*, magnet), Mn; at. wt. 54.93; at. no. 25; m.p. 1260°C; b.p. 1900°C; sp. gr. 7.2 (20°C); valence 2, 3, 4, 6, or 7. Recognized by Bergman, Scheele and others, discovered by Gahn in 1774 by reduction of dioxide with carbon.

Manganese minerals are widely distributed, oxides, silicates and carbonates being most common. Pyrolusite (MnO_2) and psilomelane are common ores. The metal is obtained by reduction of the oxide with sodium, magnesium, aluminum, or by electrolysis. It is gray-white, resembling iron, but is harder and very brittle. Its alloys with iron, copper and nickel are important. The mineral, *pyrolusite,* has been used since very early times to give color to glass; a smaller amount gives a weaker amethyst color which removes the greenish color due to iron and other impurities and makes colorless glass. Other compounds are the chloride, sulfate and permanganate, which is used as an antiseptic and in quantitative analysis because of its oxidizing power.

***Masurium** (Masurenland, in East Prussia), Ma; at. wt. 98, estimated; at. no. 43;* m.p. 2300°C; b.p. . . . . . ; sp. gr. . . . . . ; valence 2, 3, 4 or 6. Masurium is one of the eka-manganeses discovered by Noddack, Tacke (now Frau Noddack) and Berg in 1925 and occurs in the minerals *columbite, sperrylite, gadolinite* and *fergusonite.* These minerals were examined in a search for elements 43 and 75, the detection being made with the aid of the Röntgen spectrum. The quantity of masurium in these minerals and in the earth's crust, seems to be relatively very small.

Mercury (Planet Mercury), Hg (*hydrargyrum,* liquid silver); at. wt. 200.61; at. no. 80; m p. −38.87°C; b.p. 356.9°C; sp. gr. 13.546 (20°C); valence 1 or 2. Known to ancient Chinese and Hindus; found in Egyptian tombs of 1500 B.C. Mercury, the only common metal liquid at ordinary temperatures, occurs free in nature, but the chief source is the sulfide (*cinnabar,* HgS), from which it may be obtained by heating in a current of air. It is a heavy silver-white, shining metal, a fair conductor of heat and electricity, having a regular coefficient of expansion. These properties make it generally useful in the laboratory for thermometers, barometers and many other instruments. It tarnishes but slightly in the air except when heated to near the boiling point, where it is slowly converted to the oxide (HgO), from which the oxygen is set free again at higher temperatures. Mercury forms alloys, called *amalgams,* with many metals. The most important salts are mercuric chloride ($HgCl_2$, violent poison and antiseptic), mercurous chloride (HgCl, calomel laxative of medicine), mercury fulminate ($Hg(ONC)_2$, a detonator widely used in explosives), and mercuric sulfide (HgS, vermilion, a high grade red paint). Organic mercury compounds are likewise important.

Molybdenum (Gr. *molybdos,* lead), Mo; at. wt. 95.95; at. no. 42; m.p. 2620°C; b.p. 3700°C; sp. gr. 10.2; valence 2, 3, 4, 5, or 6. Recognized by Scheele; prepared in an impure form in 1782 by Hjelm. Molybdenum does not occur native, being obtained from *molybdenite* (MoS_2) and from *wulfenite*($PbMoO_4$). The metal is prepared by the reduction of the oxide with carbon, usually in the electric furnace. It is a very hard silver-white metal; it is widely used in the manufacture of certain grades of tool steel, boiler plate, rifle barrels and large cranks, as

* See element 43 at end of list.

it increases toughness and tensile strength. Being softer and more ductile than tungsten it is invaluable for the filaments, grids and screens for radios.

Neodymium (Gr. *neos*, new and *didymos*, twin), Nd; at. wt. 144.27; at. no. 60; m.p. 840°C; b.p. . . . . . . ; sp. gr. 6.95; valence 3. In 1843 reported the supposed element didymium obtained from *cerite*. In 1885 von Welsbach separated didymium into two new elements, neodymium and praseodymium by repeated fractionation of ammonium didymium nitrate. Neodymium is a metallic element, belonging to the rare earths, forming a series of pink salts with a characteristic absorption spectrum.

***Neon** (Gr. *neos*, new), Ne; at. wt. 20.183; at. no. 10; m.p. −248.67°C; b.p. −245.9°C; density 0.8990 g/l (0°C); valence 0. Discovered by Ramsay and Travers in 1898. Neon is a gaseous element present in the atmosphere to the extent of 18 parts per million. It is obtained by liquefaction of air and separated from the other elements by fractional distillation. It is an inert element forming no compounds. Neon glows red-orange in a vacuum tube and is therefore widely used in electric signs and beacons. Its spectrum is marked by pronounced red and green lines.

Nickel (Sw. abbr. of *kopparnickel*, false copper), Ni; at. wt. 58.69; at. no. 28; m.p. 1455°C; b.p. 2900°C; sp. gr. 8.90 (20°C); valence 2 or 3. Discovered by Cronstedt in 1751. Nickel is obtained chiefly from the nickel bearing *pyrrhotite* of Ontario and the *garnierite* (hydrated silicate of nickel, iron and magnesium found in New Caledonia) by roasting to the oxide, which is then reduced with carbon or carbon monoxide, volatile nickel carbonyl being formed and then decomposed by heat. The metal is hard, malleable, ductile and tenacious, of a white color, somewhat magnetic, a fair conductor of heat and electricity; it belongs to the iron-cobalt group of metals. Nickel is chiefly valuable for the alloys it forms; coinage with 75% of copper, Monel metal with copper and iron, nickel steel for armor plates and burglar proof safes, invar, constantan, permalloy, nichrome, platinite and others. Nickel plate by electrodeposition is used as a protective coating for metals, and finely divided nickel as a catalyst in the hydrogenation of vegetable oils. The sulfate and the oxides, NiO and Ni_2O_3, are important compounds.

Niobium, see *Columbium*.

Nitrogen (L. niter forming), N; at. wt. 14.008; at. no. 7; m.p. −209.86°C; b.p. −195.8°C; density 1.2506 g/l; sp. gr. liquid 0.808 (−195.8°C) solid 1.026 (−252°C) valence 3 or 5. Discovered by Daniel Rutherford in 1772. Nitrogen makes up 78% of the air by volume, the estimated amount in the atmosphere being more than 4000 billion tons; from this inexhaustible source it can be obtained by liquefaction and fractional distillation. The element is so inert that Lavoisier named it *azote*, without life, yet its compounds are so active as to be most important in foods, poisons, fertilizers and explosives. It is also prepared easily by heating a water solution of ammonium nitrite (made from ammonium chloride and sodium nitrite).

* Neptunium, see end of list.

Nitrogen is colorless, odorless and generally inert element. When heated it will combine directly with magnesium, lithium or calcium; when mixed with oxygen and subjected to electric sparks it forms first nitric oxide (NO) and then the peroxide (NO_2); when heated under pressure with a catalyst with hydrogen ammonia is formed (Haber process). The ammonia thus formed is of the utmost importance, and may be oxidized to nitric acid (Ostwald process). Sodium and potassium nitrates are formed by the decomposition of organic matter with compounds of the metals present; in certain dry areas these saltpeters are found in quantity. The chief compounds are ammonia, nitric acid, the nitrates, the five oxides (N_2O, NO, N_2O_3, NO_2, and N_2O_5) as well as very many organic substances.

Osmium (Gr. *osme*, odor) Os; at. wt. 190.2; at. no. 76; m.p. 2700°C; b.p. above 5300°C; sp. gr. 22.48 (20°C); valence 2, 3, 4, or 8. Discovered in 1803 by Tennant in the residue left when crude platinum is dissolved by *aqua regia*. Osmium occurs in *iridosime* and in platinum bearing river sands of the Urals, North America and South America. The metal is bluish-white, hard and crystalline, belonging to the platinum family. It is the heaviest known form of matter and is very infusible. When heated in air it is oxidized to OsO_4 with a pungent, irritating and poisonous vapor, which is easily reduced by organic matter. The oxide gives the element its name, and is useful in making microscopic slides. The metal has been used in making lamp filaments and with iridium forms the alloy osmiridium, which is very hard, suggesting its use for tipping gold pen points and for fine machine bearings.

Oxygen (Gr. *oxys*, acid, and *genes*, forming, acid former), O; at. wt. 16.0000; at. no. 8; m.p. −218.4°C; b.p. −183.0°C; density 1.429 g/l (0°C); sp. gr. liquid 1.14 (−183°C); valence 2. Discovered in 1774 by Priestley, who obtained it by heating mercuric oxide, using the sun's rays with a burning glass; independently by Scheele from other sources. Oxygen as a gaseous element forms 21% of the atmosphere by volume, from which it can be obtained by liquefaction and fractional distillation. Free and in compounds it makes up approximately one half of the total material on the surface of the earth, forming by weight more than one fifth of the air, about two-thirds of the human body and eight-ninths of the water, with a very high percentage in the minerals of the earth's crust. In the laboratory it is usually prepared by the electrolysis of water, or by heating potassium chlorate with manganese dioxide as a catalyst. The critical temperature and pressure are −118°C and 50 atmospheres. The gas is colorless, odorless, and tasteless; the liquid and solid forms are a pale blue color and are magnetic, but much less so than iron. Oxygen is very reactive, capable of combining with all the other elements except the inert gases in Group O and bromine. Its atomic weight is the standard of comparison for the atomic weight of each of the other elements. It is used with combustible gases in the oxy-hydrogen and oxy-acetylene flames. It is essential for respira-

tion of all animals and for practically all combustion; in medicine it is used to aid respiration.

Palladium (Planetoid Pallas), Pd; at. wt. 106.7; at. no. 46; m.p. 1553°C; b.p. 2200°C; sp. gr. 12.16 (20°C); valence 2 or 4. Discovered in 1803 by Wollaston. Palladium occurs with platinum and is obtained by ignition of the precipitated cyanide. It is a steel-white metal of the platinum family; does not tarnish in air and has the property of taking up large volumes of hydrogen with the formation of the hydride. It is used in the construction of non-magnetic watches and parts of delicate balances and in surgical instruments. The most important compound is the chloride, $PdCl_2$.

Phosphorus (Gr. *phosphoros*, light bearing), P; at. wt. 30.98; at. no. 15; m.p. 44.1°C; b.p. 280°C; sp. gr. yellow 1.82, red 2.20; valence 3 or 5. Discovered in 1669 by Brand, who prepared it from urine. Phosphorus may be prepared in three allotropic forms; white or yellow, red, black. Never found free in nature, it is widely distributed in combination in minerals, the most important being the *apatites* ($3Ca_3(PO_4)_2.CaF_2$ and $3Ca_3(PO_4)_2.CaCl_2$), which are the chief ingredients of commercial phosphates derived from South Carolina, Florida, Canada and Spain; it is an essential ingredient of all cell protoplasm, nervous tissue and bones. It may be obtained from phosphates by treatment with dilute sulfuric acid to form *o*-phosphoric acid, the concentrated solution of which is mixed with crushed charcoal or coke and dried; on heating this mixture in retorts, the phosphorus distils and is condensed. It is also prepared by heating crude phosphate with sand and coke in the electric furnace, the phosphorus distilling off. Ordinary phosphorus is a waxy solid, which is colorless when very pure, insoluble in water but soluble in carbon disulfide. It takes fire spontaneously in air, burning to the pentoxide; it is very poisonous. When heated in its own vapor to 250°C it is converted into the red variety, which does not glow in the air, does not ignite spontaneously, and is not poisonous. The production of phosphorus and its compounds has increased very rapidly in recent years; phosphoric acid is replacing sulfuric acid in the treatment of natural phosphates to make them soluble for use as fertilizers, since this causes a great increase in the percentage of P_2O_5 present and available. Organic compounds are increasing in number and in importance. Di- and tri-sodium phosphates are used as detergents in large quantities, while hexa-metaphosphate is in frequent use for the prevention of boiler scale and of corrosion in pipes and boiler tubes. Other important compounds are the phosphoric anhydride, used as a toxic smoke in warfare and made from burning phosphorus, and the chlorides, PCl_3 and PCl_5.

Platinum (Sp. *platina*, little silver), Pt; at. wt. 195.23; at. no. 78; m.p. 1773.5°C; b.p. 4300°C; sp. gr. 21.37 (20°C); valence 2 or 4. Discovered in South America by Ulloa in 1735 and by Wood in 1744. Platinum usually occurs native, accompanied by small quantities of iridium, osmium, ruthenium, rhodium and palladium, all belonging to the same group of metals.

These are usually found in alluvial deposits in the Ural mountains, in Colombia and in certain western American states. Sperrylite ($PtAs_2$) occurring with nickel bearing deposits in Canada is the source of a considerable weight of the platinum metals, which are recovered as by-products in refining the nickel. The heavy nickel production offsets the fact that there is only one part of the platinum metals in two million parts of ore. Platinum is a tin-white metal of metallic luster, tenacious, malleable and ductile; it is welded at a red heat; has a coefficient of expansion approximately equal to that of glass. The metal does not oxidize in air at any temperature, but is corroded by halogens, cyanide, sulfur and caustic alkalies; it is insoluble in hydrochloric or nitric acids, but dissolves when they are mixed as *aqua regia,* forming chloroplatinic acid (H_2PtCl_6), a very important compound. The metal is extensively used in jewelry, in wire and vessels for laboratory use, as well as many valuable instruments; in finely divided state it is an excellent catalyst, having long been used in the contact process for sulfuric acid, of which it does not now have a monopoly. The price of platinum has varied widely, being used a century or more ago to adulterate South American gold; in 1920 it was nearly eight times as valuable as gold at its price then, while it now practically equals the new value assigned to gold.

***Polonium** (Poland, native country of Mme. Marie Curie), Po; at. wt. approximately 210; at. no. 84. First element discovered by Mme. Curie (1898) in seeking cause of radioactivity of pitchblende from Joachimisthal, Bohemia. The electroscope, claimed to be 500,000 times more sensitive than the spectroscope, showed it separating with the bismuth. Polonium is also called Radium F. (See Radioactive Elements.)

Potassium (English *potash*), K (L. *kalium*); at. wt. 39.096; at. no. 19; m.p. 62.3°C; b.p. 760°C; sp. gr. 0.87 (20°C); valence 1. Discovered in 1807 by Davy, who obtained it from caustic potash (KOH); this was the first metal isolated by the aid of the electric current. The metal occurs abundantly, being the eighth element in the earth's crust, of which it makes more than 2%; most of its minerals are insoluble and the metal is obtained from them with great difficulty. Under certain conditions the salts of potassium have been concentrated from ancient ocean beds; before World War I the principal source of potassium was the mines of Stassfurt in Prussian Saxony from such beds. During this war the United States suffered a severe shortage of potassium salts, which form an essential constituent of fertilizers. Before World War II began the American production was sufficient to meet all needs; this supply came from mines in New Mexico, ancient lake beds in California and Utah, as a by-product from cement plant dust and from distillery waste. Potassium is never found free but is obtained by the electrolysis of the hydroxide. On exposure to moist air it becomes coated with a film of the oxide, and so is preserved by immersion in kerosene or naphtha. It is a soft, bright, silvery metal belonging to the alkali group; dropped on water it evolves hydrogen which takes fire spontaneously, the flame being colored violet

* Plutonium, see end of list.

by the potassium. In some cases its compounds are more readily purified by crystallization than those of sodium; important are the hydroxide, carbonate, nitrate, chloride, chlorate, bromide, iodide, cyanide, sulfate, chromate, dichromate and silicate.

Praseodymium (Gr. *prasious*, green, and *didymos*, twin), Pr; at wt. 140.92; at. no. 59; m.p. 940°C; b.p. . . . . . ; sp. gr. 6.5 (20°C); valence 3, 4 or 5. In 1843 Mosander reported the rare earth didymia obtained from lanthana; in 1879 Lecoq de Boisbaudran isolated a new earth from didymia extracted from samarskite and called it samaria. Six years later Von Welsbach separated it into two earths which gave salts of different colors Praseodymium is a metallic element from the cerium group of rare earths. It forms green salts with a characteristic absorption spectrum. The metal has been prepared by the electrolysis of the chloride.

Protoactinium (Gr. *protos*, first), Pa; at. wt. 231; at. no. 91. The first element of the actinium series of radioactive elements was discovered by Soddy and Cranston and independently by Hahn and Meitner, both in 1917. Later Grosse prepared the pure pentoxide and from this in 1934 the metal. Protoactinium has been called the "mother substance" or the "parent" of actinium, which it forms by the loss of an alpha particle, and the "patriarch" of the series; known also as ekatantalum and uranium X_2. (See Radioactive Elements.)

Radium (L. *radius*, ray) Ra; at. wt. 226.05; at. no. 88; m.p. 960°C; b.p. 1140°C; sp. gr. 5 (?); valence 2. In the form of a salt ($RaBr_2$) it was first separated by M. and Mme. Curie in 1898 from the *pitchblende* in North Bohemia, in which it occurs in about one part in three million. Isolated in 1911 by Mme. Curie and Debierne by the electrolysis of a solution of pure radium chloride, employing a mercury cathode; on distillation in an atmosphere of hydrogen this amalgam yielded the pure metal. The *carnotite* sands of Colorado furnished some radium, but richer ores were found in the Belgian Congo and later in the Great Bear Lake region of Canada, which is now the principal source. Radium is obtained commercially as the bromide or chloride. The metal is brilliant white, shows luminescence, alters very rapidly in contact with the air, decomposes water, and is somewhat more volatile than barium. The primary uses of the compounds are in producing self-luminous paints and in the treatment of certain types of cancer and skin affections. One gram of radium produces about 0.1 cubic millimeter of emanation per day; this is pumped from the radium and sealed in minute tubes, which are then applied to the diseased parts. Radium loses about 1% of its activity in 25 years, being transformed into elements of lower atomic weights. Study of radium and its activity has decidedly changed our ideas of the structure of the atom. (See Radioactive Elements.)

Radon (from radium, called niton at first, L. *nitens*, shining), Rn; at. wt. 222; at. no. 86; valence 0; m.p. −110°C; b.p. −61.8°C; sp. gr. 9.73 g/l. Discovered in 1900 by Dorn and called radium emanation; isolated in 1908 by Ramsay and Gray,

who named it niton. They determined its density, finding it to be the heaviest gas known. It occupies the last place in the zero group of gases in the Periodic Table. Since 1923 it has been called radon to show its origin from radium. Thoron and actinon are isotopes. (See Radioactive Elements.)

Rhenium (L. *Rhenus*, Rhine), Re; at. wt. 186.31; at. no. 75; m.p. 3000°C; b.p. . . . . . . ; sp. gr. 20.53 (20°C); valence 4, 5, 6, 7, 8. One of the eka-manganeses (dwi-manganese) discovered in 1925 by Noddack, Tacke and Berg in the minerals *columbite*, *tantalite* and *wolframite*. Rhenium was detected with the aid of the Röntgen spectrum; its arc spectrum has been carefully studied by Meggers. The metal can be hot forged or rolled; dissolved readily in nitric acid, slowly in sulfuric, hardly at all in hydrochloric. The price of $10,000 per gram in 1928 dropped to $3 in 1930, the production increasing a thousand fold. This has made possible the use of the element as a catalyst for dehydrogenation and in connection with other metals.

Rhodium (Gr. *rhodon*, rose), Rh; at. wt. 102.91; at. no. 45; m.p. 1985°C; b.p. above 2500°C; sp. gr. 12.5 (20°C); valence 3. Discovered in 1803 by Wollaston. Rhodium is a silver-white metal of the platinum family, occurring native with other members of this family in river sands in the Urals and in North and South America. The salts form red solutions. An alloy with platinum is used in connection with pure platinum to make thermojunctions in some forms of pyrometers. In electroplating it gives a surface unaffected by exposure to air or to strong acids or alkalies.

Rubidium (L. *rubidius*, dark red), Rb; at. wt. 85.48; at. no. 37; m.p. 38.5°C; b.p. 700°C; sp. gr. 1.53 (20°C); valence 1. Discovered in 1861 by Bunsen and Kirchhoff by the use of the spectroscope in the mineral *lepidolite*. Rubidium occurs in small quantities, also, in some mineral springs and in the rare minerals, *castor* and *pollux*, found in Elba. It is prepared by the electrolysis of the cyanide. Rubidium is a soft, white, rare, metallic element of the alkali group; it forms salts similar to those of potassium and colors the flame dark red, when held in a burner.

Ruthenium (Ruthenia, Russia), Ru; at. wt. 101.7; at. no. 44; m.p. 2450°C; b.p. above 2700°C; sp. gr. 12.2 (20°C); valence 3, 4, 6 or 8. Discovered in 1844 by Klaus more than a century after the discovery of platinum. Ruthenium, belonging to the platinum group, occurs native with the other members of this group. The metal is hard, gray, and brittle; it forms red or brown salts; ruthenous chloride ($RuCl_3$) gives a characterstic fine black precipitate with water.

Samarium (Samarski, a Russian), Sm; at. wt. 150.43; at. no. 62; m.p. above 1300°C; b.p. . . . . . ; sp. gr. 7.7–7.8; valence 2 or 3. Discovered in 1879 by Lecoq de Boisbaudran in the mineral *samarskite*, named in honor of a Russian mine official. Samarium is a metallic element belonging to the cerium group of the rare earths, occurring in very minute quantities in *samarskite*, *cerite* and certain Scandinavian minerals.

Scandium (Scandinavia), Sc. at. wt. 45.10; at. no. 21; m.p. 1200°C; b.p. 2400°C, calculated; sp. gr. 3.02 (10°C) — ?; valence 3. Predicted by Mendeleeff on the basis of the Periodic Law; discovered by Nilson in 1879. By some scandium is placed in the rare earth group. The metal has not been isolated; it forms colorless salts derived from the oxide Sc_2O_3.

Selenium (Gr. *Selene*, moon), Se; wt. wt. 78.96; at. no. 34; m.p. of gray form 220°C; b.p. 688°C; sp. gr. gray 4.8 (20°C); valence 2, 4 or 6. Discovered in 1817 by Berzelius associated with tellurium, named for the earth, hence the name chosen. The principal source of selenium is the flue dust obtained in burning pyrites in the manufacture of sulfuric acid. It is prepared in red amorphous form by reduction of selenic acid, and this on melting and keeping somewhat below the melting point becomes gray and crystalline. It is in the sulfur family, which it resembles both in the various forms of the element and in its compounds. The conductivity of electricity of the gray form increases with the brightness of the light with which it is illuminated. For this reason it can be used in photo-electric cells; its chief use is in the glass and ceramic industries. Red glass may contain colloidal selenium. It occurs in some soils in amounts sufficient to produce serious effects on animals feeding on plants grown in such soils.

Silicon (L. *silex*, flint), Si; at. wt. 28.06; at. no. 14; m.p. 1420°C; b.p. 2600°C; sp. gr. 2.42 (20°C); valence 4. First prepared by Berzelius in 1823. Next to oxygen, the most abundant element; characteristic of all abundant and important rocks except carbonates. It makes up about one-fourth of the crust of the earth. Silicon is not found free, it occurs chiefly as the oxide, silica (SiO_2) (sand, quartz, rock crystal, amethyst, agate, flint, jasper, opal, etc.) both free and in combination with the metallic oxides as silicates (granite, hornblende, asbestos, feldspar, clay, mica, etc). It is obtained as an amorphous brown powder on fusion of potassium fluosilicate with sodium or potassium; the crystalline form is obtained by passing silicon tetrachloride over melted aluminum in an atmosphere of hydrogen, or by heating potassium fluosilicate with zinc and sodium at a temperature just below the boiling point of zinc. Silicon is a non-metallic element resembling carbon in having several allotropic forms and in compounds formed. It is not attacked by acids except by a mixture of nitric and hydrofluoric acids; it is soluble in hot caustic potash or soda, evolving hydrogen and forming the corresponding silicate (K_2SiO_3 or Na_2SiO_3). Sodium silicate is of wide industrial importance. Glass, cement and clay working are called the silicate industries. An alloy of iron containing 14% of silicon is brittle, but extremely resistant to the action of acids, making it widely useful in the equipment of acid plants and in laboratory drains.

Silver (Anglo-Saxon, *soelfor*), Ag (L. *argentum*); at. wt. 107.880; at. no. 47; m.p. 960.5°C; b.p. 1950°C; sp. gr. 10.50 (20°C); valence 1. Known to ancients. Silver occurs native and in ores in combination with many non-metallic elements, as *argentite* (Ag_2S) and horn silver (AgCl); lead and copper ores

yield considerable silver. It is obtained from its ores by smelting with lead or copper, by cyanidation, or by amalgation with mercury. The metal is pure white having a brilliant luster, a little harder than gold and excelled only by that metal in malleability and ductility; it excels all other metals as a conductor of heat and electricity; it undergoes no change in water or pure air, but absorbs 22 times its volume of oxygen when melted, which is again expelled on cooling; it tarnishes in the vapors of sulfur compounds forming the black sulfide (Ag_2S). The most important compounds of silver are the nitrate ($AgNO_3$), or lunar caustic, the oxide (Ag_2O), and the halides ($AgCl$, $AgBr$), which darken on exposure to light, which is the basis of photography. A dilute solution of silver nitrate is used in medicine as an antiseptic. The metal is extensively used for coins, in jewelry and in tableware.

Sodium (English, *soda*), Na (L. *natrium*); at. wt. 22.997; at. no. 11; m.p. 97.5°C; b.p. 880°C; sp. gr. 0.971 (20°C); valence 1. Long recognized in compounds; first isolated by Davy in 1807 by electrolysis. Sodium is the most abundant of the alkali metals, being the seventh element in amount in the crust of the earth. Sodium chloride is the most common compound, but it occurs in many others. Never found free, it is obtained by the electrolysis of the chloride or hydroxide; it is a soft, bright, silvery metal. On exposure to moist air it becomes coated with a film of the oxide or hydroxide, and is preserved by immersing in kerosene or naphtha. It decomposes water with the formation of hydrogen and sodium hydroxide; it burns in air with the formation of the peroxide (Na_2O_2); it is used for the reduction of organic compounds, in the preparation of the peroxide and cyanide, and for keeping mercury clean and active in gold extraction. Soap is generally a sodium salt of certain fatty acids. Its compounds are of the widest industrial importance, being manufactured in hundreds of thousands of tons annually. Some of these are common salt ($NaCl$), soda ash (Na_2CO_3), baking soda ($NaHCO_3$), caustic soda ($NaOH$), Chile saltpeter ($NaNO_3$), di- and tri-sodium phosphates, sodium thiosulfate (hypo, $Na_2S_2O_3.5H_2O$), borate (borax, $Na_2B_4O_7.10H_2O$).

Strontium (Strontian, town in Scotland), Sr; at. wt. 87.63; at. no. 38; m.p. 800°C; b.p. 1150°C; sp. gr. 2.54 (20°C); valence 2. Discovered by Crawford, a Scotchman in 1790; metal isolated by Davy by electrolysis in 1808. Strontium is found chiefly in *celestite* ($SrSO_4$) and *strontianite* ($SrCO_3$). Prepared by the electrolysis of the fused chloride, it resembles metallic calcium in its properties; it is a hard silver-white metal. The salts are generally soluble in water with the exception of the sulfate, phosphate and carbonate; they impart a brilliant, blood-red color to the flame, and are used in pyrotechny for red fire. Strontium salts are also used in beet sugar refining.

Sulfur (L. *sulfur*), S; at. wt. 32.06; at. no. 16; m.p. rhombic 112.8°C, monoclinic 119.0°C; b.p. 444.6°C; sp. gr. rhombic 2.07, monoclinic 1.957 (20°C); valence 2, 4, or 6. Known to the ancients. Formerly obtained from the vicinity of volcanoes, active or extinct, since the beginning of this century the chief

supply has come from wells sunk into the salt domes along the Gulf coast. The Frasch process of concentric pipes with great quantities of superheated water has been used to melt and raise the sulfur, giving a product of very high purity. Sulfur is widely distributed in nature in free form; in sulfides, as iron (*pyrites*), lead (*galena*), zinc (*blende*), mercury (*cinnabar*) and antimony (*stibnite*); in sulfates, as calcium (*gypsum*), magnesium (*Epsom salt*), strontium (*celestite*) and barium (*barite* or *heavy spar*). Sulfur is a pale yellow, odorless, brittle solid, which is insoluble in water, soluble in carbon disulfide. It occurs in two crystalline forms and an allotropic form known as plastic sulfur, which reverts to the crystalline form on standing; a finely divided form known as flowers of sulfur is obtained by sublimation. It readily forms compounds known as sulfides with many elements. Sulfur is a component of black gunpowder, is widely used in the vulcanization of rubber and as a fungicide. A tremendous tonnage is used after burning to form sulfur dioxide in the manufacture of sulfuric acid, the most important manufactured chemical, and in the processes for making wood pulp for paper; sulfur dioxide is also used in fumigation and in the bleaching of dried fruits. The element is a good electrical insulating agent, and organic compounds containing sulfur are very important.

Tantalum (Gr. *Tantalos*, mythological character) Ta; at. wt. 180.88; at. no. 73; m.p. 2996°C; b.p. above 4100°C; sp. gr. 16.6; valence 3 or 5. Discovered in 1802 by Ekeberg. Tantalum occurs principally in the mineral *tantalite* ($FeTa_2O_6$), very similar to columbite, and is prepared by the reduction of K_2TaF_7 with hydrogen followed by fusion in a vacuum. It can be drawn into a wire with a very high point of fusion and great tenacity, which has been used in the construction of filaments for incandescent lamps; it has been generally replaced by tungsten, but tantalum is still used when lamps have to resist more than ordinary vibration. It is also used to alloy with other metals. It is soluble in fused alkalies, insoluble in acids; especially suited for plant work with halogens, hydrochloric acid and *aqua regia*. The common oxide is Ta_2O_5.

Tellurium (L. *tellus*, earth), Te; at. wt. 127.61; at. no. 52; m.p. 452°C; b.p. 1390°C; sp. gr. 6.24 (20°C); valence 2, 4, or 6. Discovered by Muller von Richenstein in 1782; named by Klaproth in 1798. Tellurium is found native and as the telluride of gold and other metals. It is obtained by reduction of telluric oxide and forms a powder of grayish-white, metallic appearance. It is a semi-metallic element of the sulfur group and forms tellurides with hydrogen and metals similar to the sulfides; the compounds H_2TeO_3 and H_2TeO_4 are only slightly acidic. The inhalation of the vapors of tellurium produces the very offensive "tellurium breath." It is used as a coloring agent in glass, giving a blue to brown color. Certain alloys give high electrical resistance. Addition of less than a tenth of one per cent to lead greatly increases its strength and hardness.

Terbium (Ytterby, village in Sweden), Tb; at. wt. 159.2; at. no. 65; m.p. . . . . ; b.p. . . . . . ; sp. gr. . . . . . ; valence 3.

Discovered by Mosander in 1843 from *gadolinite*. Terbium is a metal of the rare earths; in order of discovery it falls in the Yttria group; the metal has not been isolated. It yields a white oxide Tb_2O_3, and forms trivalent salts. Its name together with the names yttrium, ytterbium, and erbium, are all derived from the little Swedish town, Ytterby, where the rare earth minerals were first found.

Thallium (Gr. *thallos*, budding twig), Tl; at. wt. 204.39; at. no. 81; m.p. 303.5°C; b.p. 1650°C; sp. gr. 11.85 (20°C); valence 1 or 3. Discovered by the use of the spectroscope in 1861 by Crookes, who isolated the metal in 1862. Lamy also isolated the metal in 1862. Thallium occurs in *pyrites* and is prepared from the flue dust of sulfuric acid works. The metal is obtained by heating thallium iodide with metallic sodium; it resembles lead, having a hardness of 1.2 compared with 1.5 for lead; the malleability is high and the tenacity is low; there are two allotropic forms with a transition temperature of 226°C; it is a poor conductor of electricity, tarnishes in air forming the oxide Tl_2O, or the hydroxide TlOH in the presence of water. The element is displaced from solutions of its salts by zinc. Because of its resemblance to both the alkali metals and to the metals of Group III, thallium has been called the "paradoxical metal" and the "bird-beast metal." Its salts are poisonous, and are used in the control of rodents such as squirrels.

Thorium (*Thor*, Scandinavian god of war), Th; at. wt. 232.12; at. no. 90; m.p. 1845°C; b.p. above 3000°C; sp. gr. 11.3 (20°C); valence 4. Discovered by Berzelius in 1828. Thorium occurs chiefly in *thorite* ($ThSiO_4$) and other rare minerals. In the U. S. it is obtained chiefly from *monazite*, which contains from 3 to 9% of ThO_2. The free element has been prepared by heating the double chloride or fluoride of thorium and potassium with metallic sodium or potassium; it is a heavy, gray, difficulty fusible metal, belonging to the titanium group. It burns brightly in oxygen to form ThO_2, which is also obtained on heating the nitrate, a reaction of which use is made in the manufacture of incandescent gas mantles. Thorium emits radiations similar to but not identical with those of radium. (See Radioactive Elements.)

Thulium (*Thule*, Northland), Tm; at. wt. 169.4; at. no. 69; m.p. . . . . ; b.p. . . . . . ; sp. gr. . . . . . . ; valence 3. Discovered in 1879 by Cleve; pure thulia was prepared in 1911 by James. Thulium is in the yttrium group of the rare earth metals in order of discovery and belongs to the erbium family, which includes dysprosium, holmium and erbium also. They are obtained from certain rare minerals occurring in granite or pegmatite veins. These elements are characterized by their absorption spectra and the formation of highly colored salts; they form basic oxides of the type M_2O_3 with the following order of increasing basicity; thulium, erbium, holmium and dysprosium. The free elements have not been isolated.

Tin (Anglo-Saxon *tin*), Sn (L. *stannum*); at. wt. 118.70; at. no. 50; m.p. 231.89°C; b.p. 2260°C; sp. gr. gray 5.75, rhombic 6.55, tetragonal 7.31 (20°C); valence 2 or 4. Known to the ancients.

Tin is found chiefly in the mineral *cassiterite* (SnO_2), found in association with granitic rocks, almost none found in the U. S. It is obtained by roasting to remove sulfur and arsenic and smelting with powdered anthracite in a reverberatory furnace. Tin is found in several varieties; as ordinarily used it is a silver white metal, malleable and somewhat ductile with a low tenacity and highly crystalline structure. Due to a breaking of these crystals, the "tin cry" is heard when a bar is bent. Crystalline tin changes to gray tin at low temperatures, the speed of change reaching a maximum at −50°C. Ordinarily it takes a high polish and is used to coat other metals to prevent corrosion or other chemical action. Such tin plate over steel is used in the so called tin can for preserving food; enough is used in America each year to make a 100 foot wide belt around the earth at the equator. When heated in air, tin forms SnO_2, which is feebly acid, forming stannate salts with basic oxides. The most important salt is the chloride ($SnCl_2.2H_2O$), which is used as a reducing agent and as a mordant in calico-printing. Alloys of the metal are very important, including solder, type metal, fusible metal, pewter, bronze and bell metal.

Titanium (L. *Titans*, the first sons of the Earth, myth.), Ti; at. wt. 47.90; at. no. 22; m.p. 1800°C; b.p. above 3000°C; sp. gr. 4.5 (20°C); valence 3 or 4. Discovered by Gregor in 1791; named by Klaproth in 1795; pure metal prepared in 1910 by Hunter by heating $TiCl_4$ with sodium in a steel bomb. Titanium is almost invariably present in igneous rocks and the sedimentary material derived from them, occurring as the oxide (TiO_2), in titanates and with many iron ores. The metal is prepared by heating the oxide with aluminum or by electrolysis of the oxide dissolved in fused calcium chloride. It is a lustrous white metal in the same group with tin; it burns in air and is the only element which burns in nitrogen. The most important compounds are the oxide (TiO_2), which is feebly acidic and from which the titanates are derived; the halides (TiX_4), some of which are volatile; and the nitrides (Ti_2N_2, Ti_3N_4), metallic in appearance. The oxide is used in high grade white pigments of great opacity and covering power. The metal is used in steel alloys to increase strength.

Tungsten (Sw. heavy stone), W (G. *Wolfram*); at. wt. 183.92; at. no. 74; m.p. 3370°C; b.p. 5900°C; sp. gr. 19.3 (20°C); valence 2, 4, 5 or 6. Discovered by d'Elhujar brothers in 1783. Tungsten occurs in tungstates as *wolframite* ($FeWO_4$), *scheelite* ($CaWO_4$), *hübnerite* ($MnWO_4$). The metal is obtained by reduction of the oxide (WO_3) with hydrogen, carbon or aluminum. It is hard, brittle, nonmagnetic and forms the oxide when heated in the air. The only solvent for tungsten is a mixture of nitric and hydrofluoric acids. Because its melting point is higher than that of any other known element, its vapor pressure is extremely low, making it useful for electric wiring for furnaces, targets of X-ray tubes, contacts, arcing points; its higher electrical efficiency causes its almost exclusive use in light filaments. About 90% of the world's production is used in steel manufacture, its various steel alloys being used in armor plate, projectiles and high speed cutting tools.

Uranium (Planet Uranus), U; at. wt. 238.07; at. no. 92; m.p. about 1150°C; b.p. . . . . . . ; sp. gr. 18.68 (20°C); valence 3, 4 or 6. Discovered by Klaproth in *pitchblende* in 1789; metal first prepared in 1841 by Peligot by reducing the chloride with metallic potassium. This method is still used. The chief ore is *uraninite*, or *pitchblende*, uranous uranate, $U(UO_4)_2$; the metal is hard, white, heavy. Uranium is used chiefly in compounds which give a canary-yellow fluorescent glass and a black pigment for china painting; its compounds are used in photography. Of the generally recognized elements it has the highest atomic weight and is the last in the Periodic Table. Uranium compounds are radioactive. (See Radioactive Elements.)

Vanadium (Scandinavian goddess, *Vanadis*), V; at. wt. 50.95; at. no. 23; m.p. 1710°C; b.p. 3000°C; sp. gr. 5.96 (20°C); valence 2, 3, 4 or 5. Discovered by Sefstrom in 1830; isolated by Roscoe in 1869. Though relatively rare, vanadium is found in a variety of minerals; prominent among these are *vanadinite* ($3Pb_3(VO_4)_2.PbCl_2$) and *patronite* (possibly VS_4) occurring in Peru. Vanadium is obtained by reduction of the chloride in hydrogen, forming a gray and very infusible metal. The vanadates are employed in the preparation of aniline black and for coloring glass. Most of it is produced as ferro-vanadium and used in the manufacture of steel alloys, greatly increasing toughness, elasticity and tensile strength. V_2O_5 masses are used in the contact process for manufacture of sulfuric acid.

***Virginium** (State of Virginia), Vi; at. wt. about 224; at. no. 87; valence 1. Discovered in 1929 by Dr. Fred Allison and co-workers of Alabama Polytechnic Institute by the magneto optic method of analysis of *pollucite* and *lepidolite*. It has been found also in sea water, lake brine, Stassfurt deposits and certain other minerals. Virginium has the highest equivalent weight of any element. Named in honor of Virginia, where the discoverer was born. (Existence questioned Ed.)

Xenon (Gr. *xenon*, stranger), Xe; at. wt. 131.3; at. no. 54; m.p. −112°C; b.p. −107.1°C; density 5.85 g/l, sp. gr. liquid 3.52 (−109°C); valence O. Discovered by Ramsay and Travers in 1898 in the residue left on evaporating liquid air. It is the rarest and heaviest of the gases of the argon family from the atmosphere, in which it is present to the extent of about one part in twenty million. It is inert and forms no compounds with other elements. Vacuum tubes containing it show a beautiful blue glow.

Ytterbium (Ytterby, village in Sweden), Yb; at. wt. 173.04; at. no. 70; m.p. 1800°C; b.p. . . . . ; sp. gr. . . . . . . ; valence 3. Separated by Marignac in 1878. In 1907 Urbain and in 1908 von Welsbach described a process by which this earth containing the metal, could be resolved into earths of two other metals—neo-ytterbium, or simply ytterbium, and lutecium. These elements occur in nearly all minerals which contain yttrium, but in very small amounts. The best sources are probably *gadolinite*, *xenotime*, *polycrase* and *blomstrandine*. The oxide, chloride and sulfate have been prepared.

* See element 87 at end of list.

Yttrium (Ytterby, village in Sweden), Y; at. wt. 88.92; at. no. 39; m.p. 1490°C; b.p. 2500°C; sp. gr. 5.51; valence 3. The rare earth yttria, which contained a new element, was discovered by Gadolin in 1794; in 1843 Mosander showed that yttria could be resolved into the earths of three other elements, the name yttria being reserved for the most basic one, the others being named erbia and terbia. Yttrium occurs in nearly all of the rare earths minerals. Wöhler obtained the free element by reduction of the chloride with potassium; it has also been obtained by the electrolysis of a mixture of the chloride and sodium chloride. The metal forms small scales with a metallic luster and an iron-gray color; it is readily oxidized in air and is converted to the hydroxide by boiling water.

Zinc (G. *Zink*), Zn; at. wt. 65.38; at. no. 30; m.p. 419.5°C; b.p. 907°C; sp. gr. 7.14 (20°C); valence 2. Its ores were used for making brass for centuries before it was recognized as a separate metal in 1746 by Marggraf, who obtained it by heating calamide with charcoal. The principal ores are *sphalerite* or *blende* (sulfide), *smithsonite* (carbonate) and *calamine* (silicate). The old method of heating the roasted ore with carbon in a retort is still used, being replaced to some extent by the electrolytic process. Zinc is a bluish-white metal, brittle at ordinary temperatures but malleable at 100°C, a fair conductor of electricity; it burns in air at high red heat with evolution of white clouds of the oxide; it is used to form numerous alloys with other metals, as brass with copper. Galvanizing is coating other metals, especially iron, with zinc to prevent corrosion; the coating is sometimes applied by dipping in molten zinc. It is used as the negative electrode in various types of electric batteries. Compounds are widely used in paints, the oxide being an important white pigment; its compounds have antiseptic properties and are used in medicine. Nearly a century ago Frankland showed the use of zinc in preparing organic compounds.

Zirconium (Arabic *zargun*, gold color), Zr; at. wt. 91.22; at. no. 40; m.p. 1900°C; b.p. above 2900°C; sp. gr. 6.4 (20°C); valence 4. Discovered in *zircon* by Klaproth in 1789; isolated by Berzelius in 1824. Rather widely diffused in igneous rocks, zirconium usually occurs in the silicate, $ZrSiO_4$. The element is in the titanium family, its oxide being either base or acid forming. Prepared from the tetrachloride by heating with sodium in a bomb, the metal can be pressed into rods, drawn into wire, or burnished to a bright surface. A number of alloys have been made. Ferro-zirconium, made by aluminum reduction in an electric furnace, is used for desulfurizing and deoxidizing steel. Zircon, the silicate, is sometimes a gem. The oxide has been used in gas mantles, in paints as an opacifier, in lacquers in insulators and as an abrasive.

Americium (The Americas), Am; at. no. 95. This name has been suggested for element number 95 by Seaborg, its co-discoverer, in 1945. It appears to belong to a series of elements of which actinium is the first member.

Curium (Pierre and Marie Curie), Cm; at. no. 96. Name suggested by Seaborg for element number 96, isotopes of which were identified in 1945. The element appears to belong to the "actinide" series.

Neptunium (Planet Neptune), Np; at. wt. 237; at. no. 93; three isotopes of mass numbers 237, 238 and 239 are known.

The two isotopes Np-238 and Np-239 were isolated in 1940 by McMillan and Abelson, both produced from uranium, the first by bombardment with deuterons When uranium is bombarded with neutrons, an isotope of uranium of mass number 239 is first produced which by emission of a beta particle becomes Np-239. Both of these isotopes disintegrate to form plutonium.

Np-237 was discovered by Wahl and Seaborg in 1942 as a decay product of U-237. This isotope is relatively stable.

Plutonium (Planet Pluto), Pu; at. no. 94; valence 3, 4, 5, or 6; an artificially produced radioactive element having properties somewhat similar to uranium.

The element was discovered by Seaborg, McMillan, Wahl, and Kennedy in 1940. The isotope isolated was Pu-238 formed by deuteron bombardment of uranium which first produced Np-238. This decays to produce the plutonium isotope.

The isotope of mass number 239 is formed as a result of neutron capture by uranium-238 followed by two successive beta transformations. Both isotopes disintegrate slowly; Pu-239 has a half life of about 24,000 years, thus being essentially a stable element. This latter isotope is of tremendous importance because of being fissonable with slow neutrons, and has been used in the production of atomic bombs.

Radioactive Forms of Elements 43, 61, 85, 87. Earlier reports of the discovery of these elements, found in the preceding list under the names: masurium (43), illinium (61), alabamine (85) and virginium (87) are now called in question by recent reports of radioactive forms.

Element 43. Radioactive isotopes of element 43 were produced by the bombardment of molybdenum with deuterons. Perrier and Segrè showed that the chemical properties resemble those of rhenium.

Element 61. Radioactive forms were produced by Kurbatov and Pool and independently by Wu and Segrè. The element belongs to the class of rare earths.

Element 85. An isotope of atomic mass 211 was made by bombarding bismuth with high energy alpha particles. Its general behavior is that of a metal. Its properties were investigated by Corson, Mackenzie and Segrè.

Element 87. A radioactive form called actinum K has been discovered by Perey. It has a mass number of 223 and behaves like a heavy alkali metal. It disintegrates rapidly with negative beta particle emission.

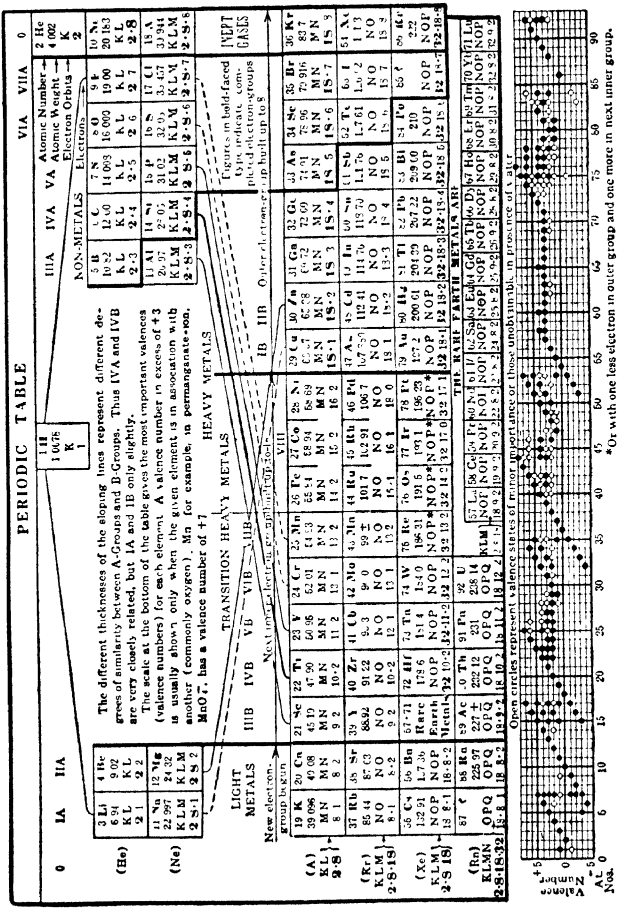
PERIODIC TABLE



From Deming's *General Chemistry*, (5th Ed.), John Wiley and Sons, publishers.

ISOTOPES

Artificial and Natural Radioactive Isotopes and Stable Isotopes

The following table is taken from a comprehensive table of isotopes compiled by Glenn T. Seaborg, Department of Chemistry, University of California, and published in Reviews of Modern Physics, January 1944. All isotopes given in the original table are listed and all data included except information as to the nuclear reaction by which the isotope was produced. For this the reader is referred to the original publication. Information may usually be obtained from the literature cited in connection with data for the isotope.

The atomic number, ***Z***, is given in the first column followed by the symbol of the isotope and the mass number ***A***. The degree of certainty is shown in the third column by letters with the following significance:

A = isotope certain (mass number and element certain)
B = isotope probable, element certain
C = one of few isotopes, element certain
D = element certain
E = element probable
F = insufficient evidence
G = probably in error (e.g., impurity or inadequate half-life determination)

The percent abundance of the stable isotopes is listed in the fourth, and the type of radiation in the fifth column. The half-life of radioactive isotopes and the energy of radiation in mega-electron volts complete the table. Symbols in parenthesis throughout the table refer to the table of references at the end.

Table of Abbreviations

α = alpha-particles
β^- = negative beta-particles
β^+ = positive beta-particles (positrons)
γ = gamma-rays
e^- = internal-conversion electrons
Be-γ-n reaction = measurement of neutron energy from Be-γ-n reaction
D-γ-n reaction = measurement of neutron energy from D-γ-n reaction
abs. = absorption
calor. = calorimetric measurements
cl. ch. = cloud chamber (with magnetic field in case of beta-particles)
cl. ch. pair = positron-electron pairs in cloud chamber with magnetic field
cl. ch. recoil = secondary electrons in cloud chamber with magnetic field
coincid. = beta- and gamma-coincidence counters (Particles column)
coincid. = gamma-gamma-coincidence counters (γ-rays column)

coincid. abs. = beta- and gamma-coincidence counters with absorbers (Particles column)

coincid. abs. = secondary electrons with coincidence counters and absorbers (γ-rays column)

d = deuteron

ion. ch. = measurement of pulse sizes in ionization chamber

I.T. = isomeric transition (transition from upper to lower isomeric state)

K = K-electron capture

K.U. = Konopinski-Uhlenbeck extrapolated value reported

n = neutron

p = proton

spect. = magnetic deflection (Particles column)

spect. = secondary electrons with magnetic spectrograph (γ-rays column)

spect. conv. = internal-conversion electrons with magnetic spectrograph

In the few cases where it is certain that no gamma-rays are emitted, this fact is expressed explicitly by the symbol "no γ." Annihilation gamma-rays are not listed.

Names and Symbols of Radioactive Elements

For convenience, the names, symbols, atomic numbers and mass numbers of radioactive elements and isotopes are arranged in alphabetical order. See also table of isotopes.

Name	Symbol	Atomic Number	Mass Number	Name	Symbol	Atomic Number	Mass Number
Actinium A	AcA	84	215	Radium D (Radiolead)	RaD	82	210
Actinium B	AcB	82	211	Radium E	RaE	83	210
Actinium C	AcC	83	211	Radon (Radium emanation, Niton)	Rn	86	222
Actinium C′	AcC′	84	211	Thorium A	ThA	84	216
Actinium C″	AcC″	81	207	Thorium B	ThB	82	212
Actinium K	AcK	87	223	Thorium C	ThC	83	212
Actinium U	AcU	92	235	Thorium C′	ThC′	84	212
Actinium X	AcX	88	223	Thorium C″	ThC″	81	208
Actinon (Actinium emanation)	An	86	219	Thorium X	ThX	88	224
Ionium	Io	90	230	Thoron (Thorium emanation)	Tn	86	220
Mesothorium 1	$MsTh_1$	88	228	Uranium I	UI	92	238
Mesothorium 2	$MsTh_2$	89	228	Uranium II (Brevium)	UII	92	234
Radioactinium	RdAc	90	227	Uranium X_1	UX_1	90	234
Radiothorium	RdTh	90	228	Uranium X_2	UX_2	91	234
Radium A	RaA	84	218	Uranium Y	UY	90	231
Radium B	RaB	82	214	Uranium Z	UZ	91	234
Radium C	RaC	83	214				
Radium C′	RaC′	84	214				
Radium C″	RaC″	81	210				

PHYSICAL CONSTANTS OF INORGANIC AND METAL-ORGANIC COMPOUNDS

PHYSICAL CONSTANTS OF INORGANIC AND METAL-ORGANIC COMPOUNDS

The names, formulas and order of entries for the inorganic compounds only have been in charge of

Janet D. Scott, S.M.,

Assistant Editor of Encyclopedia of Chemical Technology

The persons named below have rendered invaluable assistance in the revision of this table. Their cooperation is gratefully acknowledged.

H. W. Adams, Ill. State Normal Univ.

J. W. H. Aldred, Wilson Dam

A. L. Barker, Ripon College

L. G. Bassett, Rensselar Poly. Inst.

W. D. Bonner, Univ. of Utah

E. H. Boomer, Univ. of Alberta

A. B. Burg, Univ. of Chicago

J. D. Capps, Ala. Poly. Inst.

R. K. Carleton, R. I. State College

L. L. Carrick, N Dak. Agri. College

G. B. Cooke, Research Laboratories, Crown Cork & Seal Co.

E. J. Cragoe, Baker Univ.

J. L. Culbertson, State Coll. of Wash.

Jane E. Davis, Institutum Divi Thomae

O. C. Dermer, Okla. A. and M. College

C. C. DeWitt, Mich. State Coll.

W. C. Fernelius, Monsanto Chemical Company

L. S. Foster, Brown Univ.

E. F. Furtsch, Va. Poly. Inst.

C. A. Jacobson, W. Va. Univ.

Amy LeVesconte, Mary Hardin-Baylor College

Mary A. Magill, Chemical Abstracts, Ohio State Univ.

C. A. Marlies, Coll. of City of N. Y.

F. C. Mathers, Indiana Univ.

J. L. Maynard, Univ. of Minnesota

W. S. McGuire, Northeastern Univ.

J. R. Morton, Ohio Univ.

A. M. Pardee, Univ. of S. Dak.

L. R. Parks, Pa. State College

W. G. Parks, R. I. State College

V. F. Payne, Transylvania College

P. P. Powell, Ala. Poly. Inst.

A. W. Ralston, Chemical Research Dept., Armour Co.

F. W. Schwartz, Rensselar Poly. Inst.

J. W. Shipley, Univ. of Alberta

M. C. Sneed, Univ. of Minnesota

P. A. van der Meulen, Rutgers Univ.

A. A. Vernon Northeastern Univ.

O. J. Walker, Univ. of Alberta

W. O. Walker, Research Director, Ansul Chemical Co.

J. W. Watson, Va. Poly Inst.

S. Zuffanti, Northeastern Univ.

EXPLANATION OF TABLE

The table presents data for about four thousand compounds. The first section includes inorganic compounds and the metallic salts of organic acids, and the second metal-organic compounds.

It is intended that the substances listed include the more important definite compounds for which data are available. Some are listed because of their theoretical importance, even when no constants can be given.

Nomenclature and Arrangement.—The names used for the compounds conform to the best current usage insofar as this could be ascertained, the Rules for Naming Inorganic Compounds adopted January 28–29, 1938, by the Committee for the Reform of Inorganic Chemical Nomenclature of the International Union for Chemistry being used as a guide to some extent. The compounds are listed under the names of the elements in alphabetical order, except that acids and a few other compounds (e.g. hydrazine, hydroxylamine, and sulfuryl, thionyl and uranyl compounds) have their own headings. Ferrous and ferric compounds are entered under iron, stannous and stannic, under tin, cuprous and cupric, under copper and aurous and auric, under gold. Acid salts (including hydrosulfides) and many basic salts are placed immediately after the normal salts. Names like bicarbonate and bisulfate have not been used for acid salts, but names like antimony oxychloride and uranyl nitrate have been used for some basic salts. Prefixes such as di-, tri-, ortho-, meta-, pyro-, hypo-, and per- are not alphabetized. Iso-, however, and prefixes like chloro- in chloroplatinic acid are alphabetized. For the naming of binary compounds of nonmetallic elements the order of decreasing electropositivity given in the Report of the German Commission for Nomenclature (Meyer, *Helvetica Chimica Acta* 20, 159–75 (1937)) has been followed: Sb, As, B, Si, C, P, Te, Se, S, I, Br, Cl, N, O, F, except in the case of fluorine oxides, nitrogen chlorides, nitrogen iodides, etc. Binary compounds of hydrogen (except ammonia and water) are listed under arsenic hydride (instead of arsine), hydrogen chloride, hydrogen phosphide (instead of phosphine), hydrogen sulfide and like names. Most ammino compounds are grouped under headings like **Cobalt complexes** following the other compounds of the element in question, while complexes that have reasonably well-established names like chloroplatinate, cobaltinitrite, cyanoplatinite and fluoborate are listed under these names just like simpler salts. Double salts (including alums) are entered only once: (1) those with two cations are given with the more electropositive cation first in the order of the electromotive force series: Li, Rb, K, Na, NH_4, Sr, Ba, Ca, Mg, Al, U, Mn, Zn, Cr, Ga, Fe^{++}, Cd, In, Tl, Co, Ni, Sn, Pb, Fe^{+++}, Sb, Bi, As, Cu, Ag, Hg, Pd, Pt, Au (e.g. sodium aluminum sulfate, ammonium magnesium phosphate); (2) those with two anions are given with the anions in alphabetical order (e.g., strontium chloride fluoride). The finding of compounds known also under names about as common as those listed is facilitated by a **Synonym Index,** which precedes the table. Organic names conform to those used in the Table of Physical Constants of Organic Compounds.

Molecular weights have been computed to the nearest hundredth, based on the **International Atomic Weights of 1938.**

The **Crystalline form and color** are stated in easily interpreted abbreviations. Other important characteristics are often added. **Indices of refraction** are given in the same column. For crystals with two or three indices, they are invariably given in the order ω, ϵ or α, β, γ. All indices are for sodium light ($\lambda = .5893\mu$) unless otherwise stated. The temperature is assumed to be normal room temperature unless otherwise indicated by a superior figure following the index. 1.536^{25} (Li) would be interpreted as giving the value for the index of refraction of a substance for the red line of lithium at 25°C.

Specific gravity at 20°C, referred to water at 4°C, is normally given. Other temperatures are indicated by superior and inferior figures. For example: 2.64^{25}_{15} indicates a specific gravity of 2.64 at 25°C, referred to water at 15°C. It should be noted that values of specific gravity referred to water at 4°C are numerically equivalent to density in grams per milliliter. The **density of gases** is given in grams per liter, indicated g/l.

Melting and boiling points are given in °C. The boiling point is stated at normal atmospheric pressure (760 mm of Hg) unless otherwise indicated by a superscript which is to be interpreted as the pressure in mm of Hg under which the compound boils at the temperature given. For example: 250^{732} indicates a boiling point of 250°C under a pressure of 732 mm Hg; $426^{2\ atm.}$ indicates a boiling point of 426°C under a pressure of 2 atmospheres. Decomposition on heating is indicated by the abbreviation d. in melting or boiling point column. If decomposition occurs without change of state, the form d. 120 is used indicating the occurrence of decomposition at 120°C.

EXPLANATION OF TABLE

The form 120 d. would indicate a melting or boiling point of 120°C with decomposition. Loss of water of crystallization or oxygen is indicated by the form $-2H_2O$ or $-O$. The figures $-5H_2O$, 350 indicate the loss of five molecules of water of crystallization at 350°C.

Solubilities are stated for normal room temperatures, 20°C, unless otherwise indicated by a superior figure. 6.8^{25} indicates a solubility of 6.8 grams of substance in 100 ml of the solvent at 25°C. The term insoluble (i.) must be usually understood to mean that a negligible quantity of the compound dissolves. A large proportion of salts commonly regarded as insoluble really dissolve to a very slight extent. The form s.d. indicates solubility with more or less decomposition. The abbreviation d. alone in the solubility column indicates that decomposition is the primary action occurring. Solubility in acids and alkalies is usually understood to be accompanied by decomposition.

ABBREVIATIONS

a	acid
abs	absolute
ac. a	acetic acid
acet	acetone
act	active
al	alcohol
alk	alkali
amm	ammonium
amor	amorphous
anh	anhydrous
appr	approximately
aq	aqua, water
aq. reg	aqua regia
asym	asymmetrical
atm	atmospheres
bipyr	bipyramidal
bl	blue
blk	black
boil	boiling
br., brn	brown
brnsh	brownish
bz	benzene
c	cold
calc	calculated
carb	carbon
caust	caustic
chl	chloroform
choc	chocolate
cit. a	citric acid
col	colorless
coll	colloidal
com'l	commercial
comp	compounds
compl	completely
conc	concentrated
const	constant
cont	contains
corros	corrosion
cr	crystalline
cub	cubic
d, dec	decomposes
deliq	deliquescent
deriv	derivative
dibas	dibasic
di-H	dihydrogen
dil	dilute
dimorph	dimorphous
disg	disagreeable
dk	dark
doubt	doubtful
duct	ductile
effl	efflorescent
em	emerald
eth	ether
ev	evolves
evln	evolution
ex	excess
exist	existence
exp	explodes
extr	extreme(ly)
f., fr	from
feath	feathery
fl	flakes
floc	floculent
fluo, fluores.	fluorescent
form	formic
fum	fuming
fus	fused
fxd	fixed
gel., gelat	gelatinous
gl	glass
glac	glacial
glit	glittering
glob	globular
glyc	glycerin
gran	granular
greas	greasy
grn	green
h	hot
hex	hexagonal
ht	heat
hyd	hydrolyzed
hydx	hydroxides
hyg.	hygroscopic
i	insoluble
ign	ignites
ind	indigo
indef	indefinite
infl., inflam.	inflammable
infus	infusible
irid	iridescent
leaf.	leaflets
lem	lemon
lgr	ligroin
lng	long
lq., liq	liquid
lt	light
lum	luminous
lust	lustrous
me., meth	methyl
met	metal or metallic
micr	microscopic
min	mineral
misc	miscible
mixt	mixture
mod	modifications
monbas	monobasic
mon-H	monohydrogen
monocl	monoclinic
near	nearly
need	needles
nit	nitrate
oct	octahedral
odorl	odorless
offen	offensive
olv	olive
opt	optical or optically
or	orange
ord	ordinary

SYNONYM INDEX

Compound sought	Listed	Compound sought	Listed
Acanthite	Silver sulfide	Avogadrite	Potassium fluoborate
"Ajinomoto"	Sodium *d*-glutamate	Azoimide	Hydrazoic acid
Alabandite	Manganese sulfide (ous)	Azurite	Copper carbonate, basic (ic)
Alamosite	Lead *meta*silicate	Baddeleyite	Zirconium oxide, di-
Albite	Sodium aluminum silicate	Baking soda	Sodium carbonate, acid
Alum, ammonium	Ammonium aluminum sulfate	Barite	Barium sulfate
		Baryta	Barium oxide
Alum, cesium	Cesium aluminum sulfate	Benzylate	Benzyloxide
		Berlin green	Iron ferricyanide (ic)
Alum, ammonium chrome	Ammonium chromium sulfate	Bertrandite	Beryllium *ortho*silicate
Alum, ammonium gallium	Ammonium gallium sulfate	Beryl	Beryllium aluminum silicate
Alum, ammonium vanadium	Ammonium vanadium sulfate	Bieberite	Cobalt sulfate (ous)
		Binoxalate	Oxalate, acid
Alum, iron ammonium	Ammonium iron sulfate	Bischofite	Magnesium chloride
		Bismite	Bismuth oxide, tri-
Alum, iron potassium	Potassium iron sulfate	Bismuthic acid, meta-	Bismuthoxide, penta-
		Bismuthine	Bismuth hydride
Alum, manganese potassium	Potassium manganese sulfate	Bismuthinite	Bismuth sulfide, tri-
		Bismuthyl	Bismuth oxy-
Alum, potassium	Potassium aluminum sulfate	Bisulfate, -ite	Sulfate, -ite, acid
		Bleaching powder	Calcium chloride hypochlorite
Alum, potassium chrome	Potassium chromium sulfate	Bloedite	Sodium magnesium sulfate
Alum, rubidium	Rubidium aluminum sulfate		
		Blue verdigris	Copper acetate, basic
Alum, sodium	Sodium aluminum sulfate	Blue vitriol	Copper sulfate (ic)
		Bobierrite	Magnesium *ortho*-phosphate
Alum, thallium	Aluminum thallium sulfate		
		Boracic acid	Boric acid
Alumina	Aluminum oxide	Borax	Sodium *tetra*borate
Aluminic acid, meta-	Aluminum hydroxide, mono-	Boric anhydride	Boron oxide
		Borobutane	Boron hydride
Alunogenite	Aluminum sulfate	Boroethane	Boron hydride
		Borofluoric acid	Fluoboric acid
Amidophosphoric acid, tri-	Phosphoryl amide	Borofluoride	Fluoborate
Amidosulfonic acid	Sulfamic acid	Bossingaultite	Ammonium magnesium sulfate
Anatase	Titanium oxide, di-		
Anglesite	Lead sulfate	Bromellite	Beryllium oxide
Anhydrite	Calcium sulfate	Bromoazide	Bromine azide
Anhydrite, soluble	Calcium sulfate	Bromyrite	Silver bromide
Anorthite	Calcium aluminosilicate	Brookite	Titanium oxide, di-
		Brucite	Magnesium hydroxide
Aquopentamminecobalt (III) chloride	under Cobalt complexes		
		Bunsenite	Nickel oxide, mono-
Aragonite	Calcium carbonate	Butter of antimony	Antimony chloride, tri-
Arcanite	Potassium sulfate		
Argentite	Silver sulfide	Butylate	Butoxide
Arsenoferrite	Iron arsenide, di-	Calamine	Zinc silicate
Arsenolite	Arsenic oxide, tri-	Calcite	Calcium carbonate
Arsine	Arsenic hydride, tri-	Calomel	Mercury chloride (ous)
Artinite	Magnesium carbonate, basic		
		Carbon oxybromide	Carbonyl bromide
Ascharite	Magnesium *pyro*borate	Carbon oxychloride	Carbonyl chloride
		Carbon oxysulfide	Carbonyl sulfide
Atacamite	Copper oxychloride (ic)		
		Carnallite	Potassium magnesium chloride
Auricyanide	Cyanoaurate		
Auric salts	under Gold	Caro's acid	Sulfuric acid, peroxymono-
Aurocyanide	Cyanoaurite		
Aurous salts	under Gold	Cassel yellow	Lead oxychloride

Compound sought	Listed
Cassiopeum	Lutecium
Cassiterite	Tin oxide (ic)
Celestite	Strontium sulfate
Cerargyrite	Silver chloride
Cerussite	Lead carbonate
Cervantite	Antimony oxide, tetra-
Chalcanthite	Copper sulfate (ic)
Chalcocite	Copper sulfide (ous)
Chamber crystals	Nitrosylsulfuric acid
Chessylite	Copper carbonate, basic (ic)
Chloride of Millon's base	Chloride (ic) aquo-basic ammonobasic
Chlorinated lime	Calcium chloride hypochlorite
cis-Chloroaquotetrammine cobalt (III) chloride	under Cobalt complexes
Chlor(o)azide	Chlorine azide
Chlorocalcite	Potassium calcium chloride
Chloromanganokalite	Potassium manganese chloride (ous)
Chloropentammine chromium (III) chloride	under Chromium complexes
Chloropentamminecobalt (III) chloride	under Cobalt complexes
Chrome red	Lead chromate, basic
Chrome yellow	Lead chromate
Chromic anhydride	Chromium oxide, tri-
Chrysoberyl	Beryllium aluminate
Cinnabar	Mercury sulfide (ic) (α-)
Claudetite	Arsenic oxide, tri-
Clausthalite	Lead selenide
Clinoenstatite	Magnesium silicate
Columbic acid	Columbium oxide, pent-
Columbium hydroxide	Columbium oxide, pent-
Common salt	Sodium chloride
Coquimbite	Iron sulfate (ic)
Corundum	Aluminum oxide
Cotunnite	Lead chloride
Covellite	Copper sulfide (ic)
Cream of tartar, soluble	Potassium borotartrate
Cristobalite	Silicon oxide, di-
Crocoite	Lead chromate
Cryolite	Sodium aluminum fluoride
Cryolithionite	Lithium sodium aluminum fluoride
Cuprammonium	under Copper complexes
Cuprite	Copper oxide (ous)
Decaborane	Boron hydride
Dermatol	Bismuth gallate, basic
Deuterioammonia, tri-	Ammonia-d_3
Diamminecopper (II) acetate	under Copper complexes
Diamminepalladium (II) hydroxide	under Palladium complexes
Diaquotetramminenickel (II) nitrate	under Nickel complexes
Diborane	Boron hydride
Dichlorodiamminepalladium (II) *trans.*	under Palladium complexes
Digermane	Germanium hydride
Dihydropentaborane	Borane hydride
Dihydrotetraborane	Boron hydride
Disilicane	Silicon hydride
Disilicoethane	Silicon hydride
Disiloxane	Silicyl oxide
Domeykite	Copper (tri) arsenide
Dysprosia	Dyprosium oxide
Epsom salt	Magnesium sulfate
Erbia	Erbium oxide
Erythrite	Cobalt *ortho*arsenate (ous)
Erythrosiderite	Potassium iron chloride
Ethylate	Ethoxide
Ethylxanthate	Xanthate
Euclase	Beryllium aluminum silicate
Eunatrol	Sodium oleate
Europia	Europium oxide
Ferric salts	under Iron
Ferrous salts	under Iron
Fischer's salt	Potassium cobaltinitrite
Fluellite	Aluminum fluoride
Fluorite	Calcium fluoride
Gadolinia	Gadolinium oxide
Gahnite	Zinc aluminate
Galena	Lead sulfide
Germane	Germanium hydride, tetra-
Germanium bromoform	Germane, tribromo-
Germanium chloroform	Germane, trichloro-
Gibbsite	Aluminum hydroxide, tri-
Glauber's salt	Sodium sulfate
Glucinum	Beryllium
Goslarite	Zinc sulfate
Greenockite	Cadmium sulfide
Guanajuatite	Bismuth selenide tri-
Guanite	Ammonium magnesium phosphate
Gypsum	Calcium sulfate
Hafnia	Hafnium oxide
Halite	Sodium chloride
Hambergite	Beryllium *ortho*borate, basic
Hauerite	Manganese sulfide (ic)
Hausmannite	Manganese oxide (ous, ic)
Heavy hydrogen	Deuterium
Heavy water	Deuterium oxide
Hematite	Iron oxide (ic)

Compound sought	Listed
Hessite	Silver telluride
Hexamminechromium (III) chloride	under Chromium complexes
Hexamminecobalt (III) chloride	under Cobalt complexes
Hexamminecobalt (III) *per*rhenate	under Cobalt complexes
Hexaantipyrineyttrium *per*chlorate	under Yttrium complexes
Hexaantipyrineyttrium iodide	under Yttrium complexes
Hexaborane	Boron hydride
Hexabromodisilicoethane	Silicon (di-) bromide, hexa-
Hexabromoethane	Carbon bromide, tri-
Hexachlorodisilicoethane	Silicon (di-) chloride hexa-
Hexachloroethane	Carbon chloride, tri-
Hexaiododisilicoethane	Silicon (di-) iodide, hexa-
Hexaureachromium (III) fluosilicate	under Chromium complexes
Hexaureachromium (III) *per*rhenate	under Chromium complexes
Hieratite	Potassium fluosilicate
Hoernesite	Magnesium *ortho*arsenate
Hopeite, α-	Zinc *ortho*phosphate
Hopeite, β-	Zinc *ortho*phosphate
Hyacinth	Zinc *ortho*silicate
Hydriodic acid	Hydrogen iodide
Hydrobromic acid	Hydrogen bromide
Hydrocerussite	Lead carbonate, basic
Hydrochloric acid	Hydrogen chloride
Hydrocyanic acid	Hydrogen cyanide
Hydrocyanite	Copper sulfate (ic)
Hydrofluosilicic acid	Fluosilicic acid
Hydromagnesite	Magnesium carbonate, basic
Hydrosulfite	Hyposulfite
Hydroxyplatinic acid	Platinum oxide, di- (ic)
Hyposulfite	Thiosulfate
Iodide of Millon's base	Iodide (ic) aquobasic ammonobasic
Iodine hydroxide	Iodous acid, hypo-
Iod(o)azide	Iodine azide
Iodyrite	Silver iodide
Jaipurite	Cobalt sulfide, mono-
Kainite	Potassium magnesium chloride sulfate
Kalinite	Potassium aluminum sulfate
Kaluszite	Potassium calcium sulfate
Kieserite	Magnesium sulfate
Köttigite	Zinc *ortho*arsenate
Krausite	Potassium iron sulfate (ic)
Krugite	Potassium calcium magnesium sulfate
Lanarkite	Lead sulfate, basic
Langbeinite	Potassium magnesium sulfate
Lansfordite	Magnesium carbonate
Lanthana	Lanthanum oxide
Laurionite	Lead oxychloride
Laurite	Ruthenium sulfide
Lautarite	Calcium iodate
Lawrencite	Iron chloride (ous)
Lechatelierite	Silicon oxide, di-
Leonite	Potassium magnesium sulfate
Leukonin	Sodium *meta*antimonate
Lime	Calcium oxide
Litharge	Lead oxide, mono-
Luminal	Sodium phenobarbital
Magnesia	Magnesium oxide
Magnesite	Magnesium carbonate
Magnetite	Iron oxide, ferrosoferric
Malachite	Copper carbonate, basic (ic)
Manganite	Manganese hydroxide (ic)
Manganolangbeinite	Potassium manganese sulfate (ic)
Manganosite	Manganese oxide, mon- (uso)
Marcasite	Iron sulfide, di-
Marshite	Copper iodide (ous)
Mascagnite	Ammonium sulfate
Massicot	Lead oxide, mono-
Matlockite	Lead oxychloride
Medinal	Sodium barbital
Melanterite	Iron sulfate (ous)
Mendipite	Lead oxychloride
Mercallite	Potassium sulfate, acid
Mercuric bromide, ammonobasic	under Mercury-nitrogen compounds
Mercuric bromide, diammine	under Mercury-nitrogen compounds
Mercuric chloride, ammonobasic	under Mercury-nitrogen compounds
Mercuric chloride, aquobasic ammonobasic	under Mercury-nitrogen compounds
Mercuric chloride, diammine	under Mercury-nitrogen compounds
Mercuric iodide, ammonobasic	under Mercury-nitrogen compounds
Mercuric iodide, aquobasic ammonobasic	under Mercury-nitrogen compounds
Mercuric iodide, diammine	under Mercury-nitrogen compounds
Metabisulfite	*Pyro*sulfite
Metacinnabarite	Mercury sulfide (ic) (β-)
Metazirconic acid	Zirconyl hydroxide
Methylate	Methoxide

Sodium phenolate	Sodium phenoxide	Tetrasilicane	Silicon hydride
Sperrylite	Platinum arsenide	Tetrasilicobutane	Silicon hydride
Sphalerite	Zinc sulfide (β-)	Thenard's blue	Cobalt aluminate
Spherocobaltite	Cobalt carbonate (ous)	Thenardite	Sodium sulfate
Spinel	Magnesium aluminate	Thermonatrite	Sodium carbonate
Stannane	Tin hydride	Thiophosgene	Thiocarbonyl chloride
Stercorite	Sodium ammonium phosphate	Thoria	Thorium oxide, di-
Stibine	Antimony hydride	Thorite	Thorium *ortho*silicate
Stibnite	Antimony sulfide, tri-	Thulia	Thulium oxide
Stolzite	Lead tungstate	Tiemannite	Mercury selenide (ic)
Struvite	Ammonium magnesium phosphate	Triamidophosphoric acid	Phosphoryl amide
Sulfocarbolate	Phenolsulfonate	Tridymite	Silicon oxide, di-
Sulfochloride	Chloride sulfide	Trigermane	Germanium hydride
Sulfocyanate, sulfocyanide	Thiocyanate	Trisilicane	Silicon hydride
Sulfur oxychlorides	Sulfuryl, pyro-, chloride, sulfuryl chloride, thionyl chloride		
Sulfuryl amide	Sulfamide		
Sylvite	Potassium chloride		
Syngenite	Potassium calcium sulfate		
Szmikite	Manganese sulfate (ous)		

Compound sought	Listed	Compound sought	Listed
Trisilicopropane	Silicon hydride	Water glass	Sodium *tetra*silicate
Troilite	Iron sulfide (ous)	White lead	Lead carbonate, basic
Uranium nitrate	Uranyl nitrate		
Uranyl oxide	Uranium oxide, tri-	Willemite	Zinc *ortho*silicate
Valentinite	Antimony oxide, tri-	Witherite	Barium carbonate
Vanadyl bromide, etc.	Vanadium oxybromide, etc.	Wulfenite	Lead molybdate
		Wurzite	Zinc sulfide (α)
Verdigris	Copper acetate	Xanthogenate	Xanthate
Vermilion	Mercury sulfide (ic) (α)	Ytterbia	Ytterbium oxide
		Yttria	Yttrium oxide
Villiaumite	Sodium fluoride	Zaratite	Nickel carbonate, basic
Vitriol blue	Copper sulfate (ic)		
Vivianite	Iron *ortho*phosphate (ous)	Zincite	Zinc oxide
		Zinkosite	Zinc sulfate
Wallastonite	Calcium *meta*silicate (β)	Zircon	Zirconium *ortho*silicate

PHYSICAL CONSTANTS OF ORGANIC COMPOUNDS

The naming and arrangement of compounds, the preparation of the abridged form of the International Union Rules for the Naming of Organic Compounds and the Prefix Names of Organic Radicals have been in charge of

Austin M. Patterson, Ph.D.,
Professor of Chemistry and Vice President, Antioch College

The persons named below have rendered invaluable assistance in the revision of this table. Their cooperation is gratefully acknowledged by the Editor and Publishers of the Handbook of Chemistry and Physics.

H. W. Adams, Ill. State Normal Univ.

P. M. Apfelbaum, Coll. of the City of N. Y.

V. C. Aungier, Niagara Univ.

P. R. Austin, E. I. Du Pont de Nemours & Co.

J. C. Bailar, Univ. of Ill.

G. W. Bennett, Wash. and Jeff. Coll.

J. H. Billman, Indiana Univ.

J. A. Bradley, Newark Coll. of Engr.

C. M. Brewster, State Coll. of Wash.

INTERNATIONAL UNION RULES FOR THE NAMING OF ORGANIC COMPOUNDS

Editor's Note.—These rules are taken from the "Definitive Report of the Commission on the Reform of the Nomenclature of Organic Chemistry," which was unanimously adopted by the Commission and by the Council of the International Union of Chemistry at Liége in 1930. A translation of the report, with comments, appeared in the *Journal of the American Chemical Society*, **55**, 3905–25 (1933), and the reader is referred there for the full text and more extended comments. The comments here given in fine type are the editor's. A. M. P.

I. General

1. As few changes as possible will be made in terminology universally adopted.

2. For the present, only the nomenclature of compounds of known constitution will be dealt with; the question of substances of imperfectly known constitution is postponed.

3. The precise form of words, endings, etc., prescribed in the rules should be adapted to the genius of each language by the subcommittees.

II. Hydrocarbons

4. The ending *ane* is adopted for saturated hydrocarbons. Open-chain hydrocarbons will have the generic name *alkanes*.

5. The present names of the first four normal saturated hydrocarbons (methane, ethane, propane, butane) are retained. Names derived from the Greek or Latin numerals will be used for those having more than four atoms of carbon.

As the names in this series are also used in forming names of unsaturated hydrocarbons, of alcohols, aldehydes, acids, etc. a list of them is here given, with the numbers of carbon atoms:

1	Methane	27	Heptacosane
2	Ethane	28	Octacosane
3	Propane	29	Nonacosane
4	Butane	30	Triacontane
5	Pentane	31	Hentriacontane
6	Hexane	32	Dotriacontane
7	Heptane	33	Tritriacontane
8	Octane	34	Tetratriacontane
9	Nonane	35	Pentatriacontane
10	Decane	36	Hexatriacontane
11	Hendecane (Undecane)	37	Heptatriacontane
12	Dodecane	38	Octatriacontane
13	Tridecane	39	Nonatriacontane
14	Tetradecane	40	Tetracontane
15	Pentadecane	41	Hentetracontane
16	Hexadecane	42	Dotetracontane
17	Heptadecane	43	Tritetracontane
18	Octadecane	44	Tetratetracontane
19	Nonadecane	45	Pentatetracontane
20	Eicosane	46	Hexatetracontane
21	Heneicosane	47	Heptatetracontane
22	Docosane	48	Octatetracontane
23	Tricosane	49	Nonatetracontane
24	Tetracosane	50	Pentacontane
25	Pentacosane	51	Henpentacontane
26	Hexacosane	52	Dopentacontane
		53	Tripentacontane

54 Tetrapentacontane
55 Pentapentacontane
56 Hexapentacontane
57 Heptapentacontane
58 Octapentacontane
59 Nonapentacontane
60 Hexacontane

6. Branched-chain hydrocarbons are regarded as derivatives of the normal hydrocarbons; their names will be referred to the longest normal chain present in the formula by adding to it the designations of the side chains. In case of ambiguity, or if a simpler name would result, that chain which admits of the maximum of substitutions will be selected as the fundamental chain.

A simple example is 2-methylbutane, $CH_3CH(CH_3)CH_2CH_3$. The principle of "maximum of substitutions" may be illustrated as follows: In the compound

$$\begin{array}{l} CH_3CH_2CH_2CH_2CHCH_2CH_2CH_2CH_3 \\ | \\ CH(CH_3)CH(CH_3)CH_3 \end{array}$$

the longest straight chain contains nine carbon atoms, which would lead to the name 5-(1, 2-dimethylpropyl)nonane; the number of substitutions in the main chain is only one, but the radical is a complicated one. By selecting a chain of eight we get three substitutions of simpler radicals and arrive at the name 4-butyl-2,3-dimethyloctane. Rules 6 and 7 apply to saturated hydrocarbons only.

7. In case there are several side chains, the order in which such chains are named will correspond to the order of their complexity. The chain having the greatest number of secondary and tertiary atoms will be considered the most complex. The alphabetic order may also be followed in such cases.

Two possible orders to be followed in arranging the names of substituting radicals in a compound are here referred to. In the "order of complexity" the radical of lowest weight comes first, then that of next lowest weight, and so on; of those having the same weight the least branched comes first and the most branched last, thus: methyl, ethyl, propyl, isopropyl, butyl, isobutyl, etc. The "alphabetic order" would of course be: butyl, ethyl, isobutyl, isopropyl, methyl, propyl (or else butyl, *iso*butyl, ethyl, methyl, propyl, *iso*propyl). (The alphabetic order is followed in the Organic Table in this handbook.)

8. In the names of open-chain unsaturated hydrocarbons having one double bond the ending *ane* of the corresponding saturated hydrocarbon will be replaced by the ending *ene;* if there are two double bonds, the ending will be *diene,* etc. These hydrocarbons will bear the generic names *alkenes, alkadienes, alkatrienes,* etc. Examples: propene, hexene, etc.

9. The names of triple-bond hydrocarbons will end in *yne, diyne,* etc. They will bear the generic name *alkynes.* Examples: propyne, heptyne, etc.

The ending *-yne* replaces *-ine* because the latter is reserved for bases (see Rule 33).

10. If there are both double and triple bonds in the fundamental chain the endings *enyne, dienyne,* etc., will be used. The generic names of these hydrocarbons will be *alkenynes, alkadienynes,* etc.

The double bonds are expressed first in the name (ene before yne) and take precedence in numbering (cf. Rule 64). Example: CH_2:CHCH:CH-C:CH, hexa-1,3-dien-5-yne, not hex-1-yne-3,5-diene. No provision is made for branched unsaturated hydrocarbons. It seems best, for general use, to select as the fundamental straight chain the longest one that contains the maximum of double and triple bonds. Example: CH_2:C(C_2H_5)CH_2CH_3, 2-ethyl-1-butene, not 3-methylenepentane.

11. Saturated monocyclic hydrocarbons will take the names of the corresponding open-chain saturated hydrocarbons, preceded by the prefix *cyclo*. They will bear the generic name *cycloalkanes*.

Examples: cyclopropane, cyclobutane, cycloheptane.

12. When they are unsaturated, rules 8–10 will be applied. However, in the case of partially saturated polycyclic aromatic compounds the prefix *hydro*, preceded by *di-*, *tetra-*, etc., will be used. Example: dihydroanthracene.

Further examples: cyclobutadiene, cyclohexene (not tetrahydrobenzene).

13. Aromatic hydrocarbons will be denoted by the ending *ene* and will otherwise retain their customary names. However, the name *phene* may be used instead of benzene.

Examples: benzene, toluene, xylene (not benzol, toluol, xylol).

III. Fundamental Heterocyclic Compounds

14. The endings of customary names, endings which do not correspond to the function of the substance, will undergo the following modifications, so far as they are in accord with the genius of each language: (a) The ending *ol* will be changed to *ole*. Example: pyrrole. (b) The ending *ane* will be changed to *an*. Example: pyran.

15. When nitrogenous heterocycles not having the ending *ine* give basic compounds on progressive hydrogenation, such derivation will be indicated by the successive endings *ine*, *idine*. Examples: pyrrole, pyrroline, pyrrolidine; oxazole, oxazoline.

16. The ending *a* is adopted for hetero atoms occurring in a ring. Oxygen will accordingly be indicated by *oxa*, sulfur by *thia*, nitrogen by *aza*, etc. The letter *a* may be elided before a vowel. Examples: thiadiazole, oxadiazole, thiazine, oxazine.

While the universally accepted names of heterocyclic compounds are retained, the names of other heterocyclic compounds are derived from that of the corresponding homocyclic compound by adding to it the names of the hetero atoms ending in *a*. Example: 2, 7, 9-triazaphenanthrene.

The custom of naming complex heterocyclic ring systems from the names of their component rings (as, anthrapyrrole, naphthopyridine) is so "universally accepted" that it will no doubt continue to be followed. The rule adds a useful new device for certain cases.

RULES FOR NAMING ORGANIC COMPOUNDS (Continued)

IV. Simple Functions

17. Substances of simple functions are defined as those containing a function of one kind only, which may be repeated several times in the same molecule.

That is, an alcohol may have one, two or more OH groups and still be a substance of simple function, while a hydroxy aldehyde or an amino acid is one of complex function.

18. When there is only one functional group, the fundamental chain will be selected so as to contain this group. When there are several functional groups the fundamental chain will be selected so as to contain the maximum number of these groups.

Example: $CH_3CH_2CH(COOH)_2$, 2-ethylpropanedioic acid (ethylmalonic acid). According to the original Geneva system it was butanoic-2-methyloic acid.

19. Halogen derivatives will be designated by the name of the hydrocarbon from which they are derived, preceded by a prefix indicating the nature and number of the halogen atoms.

Examples: C_2H_5Cl, chloroethane; CH_2BrCH_2Br, 1, 2-dibromoethane.

20. Alcohols and phenols will be given the name of the hydrocarbon from which they are derived, followed by the suffix *ol*. In accordance with rule 1 names universally adopted will be retained, as: phenol, cresol, naphthol, etc.

This nomenclature may also be applied to heterocycles. Example: quinolinol.

Further examples: $CH_3CHOHCH_3$, 2-propanol; $C_6H_{11}OH$, cyclohexanol.

21. In naming polyhydric alcohols or phenols, one of the forms *di*, *tri*, *tetra*, etc., will be inserted between the name of the parent hydrocarbon and the suffix *ol*.

Examples: CH_2OHCH_2OH, 1, 2-ethanediol; *p*-$C_6H_4(OH)_2$, 1, 4-benzenediol.

22. The name *mercaptan* as a suffix is abandoned; this function will be denoted by the suffix *thiol*.

Examples: CH_3SH, methanethiol; CH_2SHCH_2SH, 1, 2-ethanedithiol.

23. Ethers are considered as hydrocarbons in which one or several hydrogen atoms are replaced by alkoxy groups. However, for symmetrical ethers the present nomenclature may be retained. Examples: $CH_3OC_2H_5$, methoxyethane; CH_3OCH_3, methoxymethane or methyl ether.

24. Oxygen linked, in a chain of carbon atoms, to two of these atoms will be denoted by the prefix *epoxy* in all cases where it would be unprofitable to name the substance as a cyclic compound. Examples: ethylene oxide = epoxyethane; epichlorohydrin = 3-chloro-1,2-epoxypropane; tetramethylene oxide = 1,4-epoxybutane.

25. Sulfides, disulfides, sulfoxides and sulfones will be named like the ethers, *oxy* being replaced by *thio*, *dithio*, *sulfinyl* and

sulfonyl, respectively. Examples: $CH_3SO_2C_2H_5$, methylsulfonylethane; $CH_3SC_3H_7$, methylthiopropane; $CH_3CH_2CH_2$-$SOCH_2CH_2CH_2CH_3$, 1-(propylsulfinyl)butane.

26. Aldehydes are characterized by the suffix *al* added to the name of the hydrocarbon from which they are derived; thioaldehydes, by the suffix *thial.* Acetals will be named as 1,1-dialkoxyalkanes.

Examples: CH_3CHO, ethanal; CHOCHO, ethanedial; CH_3CH_2CHS propanethial; $CH_3C(OC_2H_5)_2$, 1,1-diethoxyethane; C_6H_5CHO, benzenecarbonal? (cf. rule 32, paragraph 2).

27. Ketones will receive the ending *one.* Diketones, triketones, thioketones will be designated by the suffixes *dione, trione, thione.*

Examples: CH_3COCH_3, 2-propanone; $CH_3COCOCH_3$, 2, 3-butanedione· $CH_3CSCH_2CH_3$, 2-butanethione; cyclohexanone.

28. The name *ketene* is retained.

Example: $(CH_3)_2C{:}CO$, dimethylketene.

29. For acids the rule of the Geneva nomenclature is retained. However, in cases where the use of that nomenclature would not be convenient the carboxyl group will be considered as a substituting group and the name of the acid will be formed by adding to the name of the hydrocarbon the suffix *carbonique* or *carboxylic,* according to the language.

Examples: CH_3CH_2COOH, propanoic acid; $HOOCCH_2COOH$, propanedioic acid; $HOOCCH_2CH(COOH)CH_2COOH$, 1, 2, 3-propanetricarboxylic acid. In the Geneva system the last-named compound would have been called pentanedioic-3-methyloic acid.

30. Acids in which an atom of sulfur replaces an atom of oxygen will be named according to the Geneva nomenclature. Example: ethanethioic, -thiolic, -thionic, -thionothiolic. If the carboxyl is considered as a substituent the compounds will be named *carbothioic* acids. The suffix *carbothiolic* will be used if it is certain that the oxygen of the OH group is replaced by sulfur; the suffix *carbothionic* if it is the oxygen of the CO group; the suffix *carbodithioic* will be used if both oxygen atoms are replaced.

Examples of the two systems of names: CH_3COSH or CH_3CSOH (either one), ethanethioic acid, methanecarbothioic acid; CH_3COSH, ethanethiolic acid, methanecarbothiolic acid; CH_3CSOH, ethanethionic acid, methanecarbothionic acid; CH_3CSSH, ethanethionothiolic acid, methanecarbodithioic acid.

31. The existing conventions will be retained for salts and esters.

Examples: Sodium butanoate or sodium salt of butanoic acid; diethyl 1,2-ethanedicarboxylate or diethyl ester of 1,2-ethanedicarboxylic acid; sodium acetate; methyl succinate.

32. Acid anhydrides will retain their present mode of designation according to the names of the corresponding acids. For names formed in accordance with the Geneva nomenclature,

the amides, amidoximes, amidines, imides and nitriles will be named like the acids by adding to the name of the corresponding hydrocarbon the endings *amide*, *amidine*, *amidoxime*, *imide*, and *nitrile*, respectively, while the halides will be named by combining *chloride*, etc., with the name of the radical. Examples: C_3H_7COCl, butanoyl chloride; $C_3H_7CONH_2$, butanamide; etc.

If the carboxyl is considered as a substituent the endings *carbonamide*, *carbonamidine*, *carbonamidoxime*, *carbonimide*, *carbonitrile* will be used. Examples: C_3H_7COCl, propanecarbonyl chloride; $C_3H_7CONH_2$, propanecarbonamide; etc.

33. The ending *ine* is reserved exclusively for nitrogenous bases. The present nomenclature of monoamines is retained. For polyamines, the name of the hydrocarbon will be followed by the suffixes *diamine*, *triamine*, etc.

For aliphatic compounds containing quinquevalent nitrogen the ending *ine* will be changed to *onium*. For cyclic substances containing quinquevalent nitrogen in the ring the ending *ine* will be changed to *inium*; for those with the ending *ole*, this will be changed to *olium*. Examples: pyridine, pyridinium; imidazole, imidazolium.

Further examples: CH_3NH_2, methylamine; $(CH_3)_2NH$, dimethylamine; $(CH_3)_3N$, trimethylamine; $NH_2CH_2CH_2NH_2$, 1,2-ethanediamine; dextrin (not dextrine); glycerol (not glycerine).

34. (revised 1938) (a) Derivatives of hydrogen arsenide, AsH_3, will be named like the amines and their derivatives, with the ending *arsine*. The univalent radical $-AsH_2$ will be designated by the prefix *arsino*.

Examples: CH_3AsH_2, methylarsine; $(CH_3)_3As$, trimethylarsine; $(CH_3)_2AsCl$, chlorodimethylarsine; $(CH_3)_3AsO$, trimethylarsine oxide; $H_2AsCH_2CH_2AsH_2$, 1, 2-diarsinoethane or ethane-1, 2-diarsine; $(C_2H_5)_4AsOH$, tetraethylarsonium hydroxide; $(CH_3)_2AsAs(CH_3)_2$, tetramethylbiarsine.

(b) Acids of the types $RHAs(:O)OH$ and $RR'As(:O)OH$ will be named *arsinic* acids; those of the type $RAs(:O)(OH)_2$ will be named *arsonic acids*. The radical $>AsO_2H$ will be designated by the prefix *arsinico*, the radical $-AsO_3H_2$ by the prefix *arsono*.

Examples: $(CH_3)_2AsO_2H$, dimethylarsinic acid; $C_6H_5AsO_3H_2$, benzenearsonic acid.

(c) Rules *a* and *b* are applicable to the analogous compounds of phosphorus and antimony, the syllable "ars" being replaced respectively by *phosph* or *stib*.

(d) The following list includes the prefixes and suffixes applicable to the most common compounds of phosphorus, arsenic and antimony:

Radical	*Prefix*	*Suffix*
$-AsH_2$	arsino	arsine
$-AsO$	arsenoso	
$-AsO_2$	arso	
$>As(:O)OH$	arsinico	arsinic
$-As(:O)(OH)_2$	arsono	arsonic
$-As = As-$	arseno	
$-PH_2$	phosphino	phosphine
$-PO$	phosphoroso	
$-PO_2$	phospho	
$>P(:O)OH$	phosphinico	phosphinic
$-P(:O)(OH)_2$	phosphono	phosphonic
$-P = P-$	phosphoro	
$-P = N-$	phosphazo	
$-P = As-$	phospharseno	
$-SbH_2$	stibino	stibine
$-SbO$	stiboso	
$-SbO_2$	stibo	
$>Sb(:O)OH$	stibinico	stibinic
$-Sb(:O)(OH)_2$	stibono	stibonic
$-Sb = Sb-$	antimono	
$-Sb = As-$	stibarseno	

(e) Derivatives of bismuthine, BiH_3, will be named like the arsines.

(f) Compounds of arsenic, phosphorus, antimony and bismuth which cannot be named clearly by the preceding rules will be named as derivatives of arsines, phosphines, stibines or bismuthines or (if possible) as organometallic derivatives (rule 48).

Examples: CH_3BiO, methylbismuth oxide; CH_3SbCl_4, methylantimony tetrachloride; $(C_6H_5)_2AsOC_2H_5$, ethoxydiphenylarsine; $(CH_3)_2AsOH$, hydroxydimethylarsine or dimethylarsenic hydroxide; CH_3SbS, methylantimony sulfide; $[(CH_3)_2As]_2O$, bis(dimethylarsenic) oxide or cacodyl oxide.

35. Compounds derived from hydroxylamine by replacement of the hydrogen of the hydroxyl will be regarded as alkoxy derivatives; those in which an atom of hydrogen of the NH_2 group is replaced, as alkylhydroxylamines. Oximes will be named by adding the suffix *oxime* to the name of the corresponding aldehyde, ketone or quinone. Examples: $C_2H_5ONH_2$ ethoxyamine; C_2H_5NHOH, ethylhydroxylamine.

Further examples: $CH_3CH_2CH{:}NOH$, propanal oxime; $CH_3C(:NOH)CH_3$, propanone oxime.

36. The generic term *urea* is retained; it will be used as a suffix for the alkyl and acyl derivatives of urea. Examples: butylurea, $C_4H_9NHCONH_2$; butyrylurea, $C_3H_7CONHCONH_2$. The bivalent radical -NHCONH- will be named *ureylene.*

37. The generic name *guanidine* is retained.

38. The name *carbylamine* is retained.

Example: C_2H_5NC, ethylcarbylamine (or ethyl isocyanide).

39. Isocyanic and isothiocyanic esters (RNCO, RNCS) will be named *isocyanates* and *isothiocyanates*.

40. The name *cyanate* is reserved for true esters which on saponification yield cyanic acid or its hydration products. The name *sulfocyanate* will be replaced by *thiocyanate*.

41. Nitro derivatives: no change in the present nomenclature.

Examples: C_6H_5NO, nitrosobenzene; $(NO_2)_3C_6H_2OH$, trinitrophenol.

42. Azo derivatives: the forms *azo*, *azoxy* are retained.

43. (a) Diazonium compounds, RN_2X, are named by addition of the suffix *diazonium* to the name of the parent substance (benzenediazonium chloride).

(b) Compounds having the same empirical formula but containing trivalent nitrogen will be named by replacing diazonium with *diazo* (benzenediazohydroxide).

(c) Substances of the type RN_2OM will be named *diazoates*.

(d) Compounds in which the two nitrogen atoms are united to a single carbon atom will be designated by the prefix *diazo* (diazomethane, diazoacetic acid).

(e) The term *diazoamino* is retained; however, these compounds may also be regarded as derivatives of triazene.

(f) Derivatives of the substances $H_2NNHNHNH_2$; $NH:NNHNH_2$; $NH:NNHN:NH$ will be named *tetrazanes*, *tetrazenes*, *pentazdienes*, etc.

Examples: (a) $C_6H_5N(.N)Cl$, benzenediazonium chloride; (b) $C_6H_5N:NOH$, benzenediazohydroxide; (c) $C_6H_5N:NONa$, sodium benzenediazoate; (d) N_2CH_2, diazomethane; N_2CH_2COOH, diazoacetic acid, diazoethanoic acid or diazomethanecarboxylic acid; (e) $C_6H_5N:NNHC_6H_5$, diazoaminobenzene or 1,3-diphenyltriazene; (f) $C_6H_5NHNHNHNHC_6H_5$, 1,4-diphenyltetrazane; $C_6H_5N:NNHNH_2$, 1-phenyl-1-tetrazene.

44. Hydrazines are designated by the name of the alkyl radicals from which they are derived, followed by the suffix *hydrazine*. In cases where the amino group of carbonamides is replaced by the hydrazino group, the suffix *hydrazide* will be used. Hydrazo derivatives are regarded as derivatives of hydrazine. Examples: CH_3NHNH_2, methylhydrazine; $C_2H_5NHNHC_3H_7$, 1-ethyl-2-propylhydrazine; $C_3H_7CONHNH_2$, butyrohydrazide or propanecarbohydrazide.

45. Hydrazones and semicarbazones are named like the oximes. The term *osazone* is retained.

Examples: $CH_3CH:NNHC_6H_5$, ethanal (or acetaldehyde) phenylhydrazone: $(CH_3)_2C:NNHCONH_2$, propane (or acetone) semicarbazone.

46. The name *quinone* is retained.

Examples: *p*-benzoquinone or *p*-quinone, 1,2-naphthoquinone or 1,2-naphthaquinone, phenanthrenequinone or phenanthraquinone.

47. Sulfonic and sulfinic acids will be designated by adding the suffixes *sulfonic* and *sulfinic* to the name of the hydrocarbon.

The analogous acids of selenium and tellurium will bear the names *alkaneselenonic* and *-seleninic* acids; *alkanetelluronic* and *-tellurinic* acids.

Examples: $C_2H_5SO_3H$, ethanesulfonic acid, $C_{10}H_6(SO_2H)_2$, naphthalenedisulfinic acid; CH_3SeO_3H, methaneselenonic acid; $C_6H_5TeO_2H$, benzenetellurinic acid.

48. Organometallic compounds will be designated by the names of the organic radicals united to the metal which they contain, followed by the name of the metal. Examples: dimethylzinc, tetraethyllead, methylmagnesium chloride.

However, if the metal is united in a complex manner it may be considered as a substituent Example: $ClHgC_6H_4CO_2H$, chloromercuribenzoic acid.

49*a* (revised 1938)

I. Cyclic hydrocarbons with aliphatic side chains are to be named according to one of the two following methods: (α) The radical names denoting the side chains are prefixed to the name of the cyclic hydrocarbon. (β) The cyclic hydrocarbon residue, if it can be named as a radical, is considered a substituent of the aliphatic chain. Naming according to (α) is in general preferable when the side chain is short or when several side chains are present. Naming according to (β) is more convenient when the side chain is long, and particularly when the cyclic hydrocarbon residue is not at the end of this chain.

Examples: (α) $C_6H_5C_2H_5$, ethylbenzene; $CH_3C_6H_4C_2H_5$, methylethylbenzene; $C_{10}H_7CH{:}CH_2$, ethenylnaphthalene.
(β) $CH_3CH(C_6H_5)(CH_2)_5CH_3$, 2-phenyloctane; p-$(CH_3)_2CHC_6H_4CH(CH_3)CH(CH_3)(CH_2)_3CH_3$, 3-methyl-2-(4-isopropylphenyl)heptane.

For naming cyclic hydrocarbons with side chains according to (α), it is advisable in many cases to use the common names of simple aromatic hydrocarbons.

Examples: *o*-$CH_3C_6H_4C_2H_5$, 2-ethyltoluene; $(CH_3)_2C_6H_4CH{:}CH_2(1,3,2)$, 2-ethenyl-*m*-xylene; $CH_3C_6H_3(C_2H_5)CH(CH_3)_2(1,2,4)$, 2-ethyl-*p*-cymene.

II. When several cyclic hydrocarbon residues are united by an aliphatic chain the name of the compound will be derived from that of the aliphatic hydrocarbon, provided radical names are available for the cyclic hydrocarbon residues.

Examples: $C_6H_5CH_2C_6H_5$, diphenylmethane; $C_6H_5CH_2CH(C_6H_5)(CH_2)_2CH_3$, 1,2-diphenylpentane.

If this is not the case, or if the possibility of using a convenient radical name makes it desirable, the name of the compound will be derived from that of one of the cyclic hydrocarbons, on the principle of substitution.

Examples: $C_{14}H_9CH_2C_6H_5(2)$, 2-benzylanthracene (better than phenyl-(2-anthryl) methane); $C_{16}H_9CH_2CH_2C_6H_5$, (β-phenylethyl) pyrene.

49*b* (revised 1938). When the cyclic hydrocarbons treated of in rule 49*a* carry functions which can be expressed only by a prefix, the same possibilities for names exist as those indicated in rule 49*a*.

Examples: $C_6H_5CHClCH_2Cl$, 1,2-dichloro-1-phenylethane or (α, β-dichloroethyl) benzene; $C_6H_5CH_2CHCH_3CH_2Cl$, 3-chloro-2-methyl-1-phenylpropane or (γ-chloroisobutyl) benzene; *p*-$ClC_6H_4CH_2CH_2Cl$, 4-chloro-1-(β-chloroethyl) benzene or 2-chloro-1-(4-chlorophenyl) ethane.

For naming derivatives of monocyclic hydrocarbons which have common names, it will be of advantage to employ these names.

Examples: p-$ClC_6H_4CH_3$, 4-chlorotoluene (4-chloro-1-methylbenzene); p-$ClC_6H_4CH_2Cl$, 4, ω-dichlorotoluene (4-chloro-1-(chloromethyl) benzene, 4-chlorobenzyl chloride); $CH_3C_6H_3(NO_2)CH(CH_3)_2(1,2,4)$, 2-nitro-$p$-cymene (2-nitro-1-methyl-4-isopropylbenzene).

50. If it is necessary to avoid ambiguity, the names of complex radicals will be placed in parentheses. Examples: (dimethylphenyl)amine = $(CH_3)_2C_6H_3NH_2$; dimethylphenylamine = $C_6H_5N(CH_3)_2$.

V. Complex Functions

51. For compounds of complex function, that is to say, for compounds possessing different functions, only one kind of function (the principal function) will be expressed by the ending of the name. The other functions will be designated by appropriate prefixes.

Example: 2-aminoethanol (not ethanolamine). By rule 1 very commonly used names like phenolsulfonic acid, naphthylaminesulfonic acid might still be used.

52. The following prefixes and suffixes will be used for designating the functions.

Function	Prefix	Suffix
Acid and derivatives	carboxy	carboxylic, carbonyl, carbonamide, etc., or oic, oyl, etc.
Alcohol	hydroxy	ol
Aldehyde	oxo, aldo (for aldehyde O) or formyl (for CHO)	al
Amine	amino	amine
Azo derivative	azo	. . .
Azoxy derivative	azoxy	. . .
Carbonitrile (nitrile)	cyano	carbonitrile or nitrile
Double bond	. .	ene
Ether	alkoxy	. . .
Ethylene oxide, etc.	epoxy	. . .
Halide	halogeno (halo)	. . .
Hydrazine	hydrazino	hydrazine
Ketone	oxo or keto	one
Mercaptan	mercapto	thiol
Nitro derivative	nitro	. . .
Nitroso derivative	nitroso	. . .
Quinquevalent nitrogen	. . .	onium, inium (olium)
Sulfide	alkylthio	. . .
Sulfinic derivative	sulfino	sulfinic
Sulfone	sulfonyl	. . .
Sulfonic derivative	sulfo	sulfonic
Sulfoxide	sulfinyl	. . .
Triple bond	. . .	yne
Urea	ureido	urea

The order in which the functions are here listed has no significance; the rules do not establish any general order of precedence (cf. rules 7, 63).

53. The names of derivatives of fundamental heterocyclic substances will be formed according to the preceding rules.

Example: Hydroxyquinolinecarbonamide, not quinolinolcarbonamide.

VI. Radicals

54. Univalent radicals derived from saturated aliphatic hydrocarbons by removal of one atom of hydrogen will be named by replacing the ending *ane* of the hydrocarbon by the ending *yl*.

Examples: methyl, ethyl, pentyl (or amyl), etc. Since isopropylidene is recognized (rule 56) it was no doubt the intention of the Committee to recognize isopropyl similarly.

55. The names of univalent radicals derived from unsaturated aliphatic hydrocarbons will have the endings *enyl*, *ynyl*, *dienyl*, etc., the positions of the double or triple bonds being indicated by numerals or letters where necessary.

Examples: CH_2:CH—, ethenyl (or vinyl); CH⋮C—, ethynyl; CH_3—CH:CH—CH_2—, 2-butenyl; CH_2:CH—CH:CH—, 1, 3-butadienyl.

56. Bivalent or trivalent radicals derived from saturated hydrocarbons by removal of 2 or 3 hydrogen atoms from the same carbon atom will be named by replacing the ending *ane* of the hydrocarbon by the endings *ylidene* or *ylidyne*. For radicals derived from unsaturated hydrocarbons, these endings will be added to the name of the hydrocarbon. The names isopropylidene and methylene are retained.

Examples: $CH_2<$, methylene; $CH_3CH<$, ethylidene; $CH_3CH_2CH<$, propylidene; $(CH_3)_2C<$, (1-methylethylidene) or isopropylidene, $CH_3C⋮$, ethylidyne; CH_2.CH—$CH_2CH<$, 3-butenylidene.

57. The names of bivalent radicals derived from aliphatic hydrocarbons by removal of a hydrogen atom from each of the two terminal carbon atoms of the chain will be ethylene, trimethylene, tetramethylene, etc.

Only saturated radicals are provided for: —CH_2CH_2—, ethylene; —CH_2-CH_2CH_2—, trimethylene, etc.

58. Radicals derived from acids by removal of OH will be named by changing the ending carboxylic to *carbonyl* or, if the Geneva nomenclature is used, oic to *oyl*.

Examples: CH_3CO, ethanoyl or methanecarbonyl (or acetyl).

59. Univalent radicals derived from aromatic hydrocarbons by removal of a hydrogen atom from the ring will in principle be named by changing the ending *ene* to *yl*. However, the radicals C_6H_5 and $C_6H_5CH_2$ will continue provisionally to be named phenyl and benzyl respectively. Moreover, certain abbreviations sanctioned by usage are authorized, as *naphthyl* instead of *naphthalyl*.

Examples: $CH_3C_6H_4$—, tolyl (instead of toluyl), anthryl (instead of anthracyl), phenanthryl, fluoryl.

60. Univalent radicals derived from heterocyclic compounds by removal of hydrogen from the ring will be named by changing their endings to *yl*. In cases where this would give rise to ambiguity, merely the final *e* will be changed to *yl*. Examples: pyridine, pyridyl; indole, indolyl; pyrroline, pyrrolinyl; triazole, triazolyl; triazine, triazinyl.

61. Radicals formed by removal of a hydrogen atom from a side chain of a cyclic compound will be regarded as substituted aliphatic radicals.

Examples: $C_6H_5CH_2CH_2$—, (2-phenylethyl); $C_6H_5CH{:}CHCH_2$—, (3-phenyl-2-propenyl). (For $C_6H_5CH_2$, see rule 59.)

62. In general, special names will not be given to multivalent radicals derived from cyclic compounds by removal of several hydrogen atoms from the ring. In this case prefixes or suffixes will be used. Examples: triaminobenzene or benzenetriamine; dihydroxypyrrole or pyrrolediol.

Comparison with rules 21, 33 and 51 will show that of the names given as examples, "benzenetriamine" and "pyrrolediol" are the ones ordinarily to be preferred (according to the rule of expressing the principal function in the ending of the name where there is a suffix denoting it).

63. The order in which prefixes or radicals are stated (alphabetic order or conventional order) remains optional.

See the comments on rule 7. There is no generally accepted "conventional order" for all prefixes.

VII. Numbering

64. In aliphatic compounds the carbon atoms of the fundamental chain will be numbered from one end to the other with the use of arabic numerals. In case of ambiguity the lowest numbers will be given (1) to the principal function, (2) to double bonds, (3) to triple bonds, (4) to atoms or radicals designated by prefixes. The expression "lowest numbers" signifies those that include the lowest individual number or numbers. Thus, 1, 3, 5 is lower than 2, 4, 6; 1, 5, 5 lower than 2, 6, 6; 1, 2, 5 lower than 1, 4, 5; 1, 1, 3, 4 lower than 1, 2, 2, 4.

Examples: $CH_2{:}CHCH_2CH_3$, 1-butene (not 3-butene); $CH_2{:}CHC{:}CH$, 1-buten-3-yne (not 3-buten-1-yne); $CH_2{:}CH—CH_2OH$, 2-propen-1-ol (not 1-propen-3-ol; the name allyl alcohol may also be used); $CHCl_2—CH_2CH{:}CH_2$, 4, 4-dichloro-1-butene. The principle of "low numbers" also applies to cyclic compounds, with due regard to their different structures (e.g., bridges and hetero atoms are usually given preferred positions). Examples: 1, 3-cyclohexadiene; 3-cyclohexen-1-one or simply 3-cyclohexenone; 4, 4-dichlorocyclohexene.

Position of Numbers.—Where shall position numbers be placed, *before* or *after* the parts of the name to which they refer? Usage varies; some chemists place them before, some place them after, some use a combination. The Committee has left full latitude on this point. The examples in the French version usually show the numbers placed after; the examples in these comments follow the practice of *Chemical Abstracts* in being placed before. Each method has certain advantages. In Beilstein numbers placed after are in parentheses, those placed before are not, e.g., "2-methyl-butanol-(4)."

65. Positions in a side chain will be designated by numerals or letters, starting from the point of attachment. The numerals or letters will be in parentheses with the name of the chain.

Examples: $(CH_3)_2CH$—, (1-methylethyl) or isopropyl; $CH_3CHClCH_2$—, (2-chloropropyl). The rule equally permits Greek letters, ordinary letters, primed numbers (1′, 2′), numbers with indices (4^1, 4^2) or other designations.

66. In case of ambiguity in the numbering of atoms or radicals designated by prefixes, the order will be that chosen for the prefixes before the name of the fundamental compound or side chain of which they are substituents.

Example: $CH_2BrCH_2CH_2Cl$, 1-bromo-3-chloropropane (alphabetic order), or 1-chloro-3-bromopropane (order of increasing radical weight). The purpose of the rule is to decide which prefixes shall have which numbers, when the set of numbers (in the above example 1, 3) for the prefixes has been determined.

67. The prefixes, *di*, *tri*, *tetra*, etc. will be used before simple expressions (for example, diethylbutanetriol) and the prefixes *bis*, *tris*, *tetrakis*, etc., before complex expressions. Examples: bis(methylamino)propane, $CH_3NH(CH_2)_3NHCH_3$; bis-(dimethylamino)ethane, $(CH_3)_2NCH_2CH_2N(CH_3)_2$. The prefix *bi* will be used only to denote the doubling of a radical or compound; for example, biphenyl.

Additional example of the use of *bi*: *p*-$(C_6H_4CO_2H)_2$, 4, 4′-bibenzoic acid or biphenyl-4, 4′-dicarboxylic acid.

68. A catalog of cyclic systems, with their numberings according both to the existing system and to that of Mr. Patterson, is in preparation under the auspices of the National Research Council of the United States and of the American Chemical Society.

This catalog appeared in 1940 as American Chemical Society Monograph No. 84, "The Ring Index" by Austin M. Patterson and Leonard T. Capell.

In order to avoid all confusion the Commission recommends placing a scheme of numbering at the head of each article.

INTERNATIONAL UNION RULES

(Numbers refer to the individual rules)

RULES FOR NAMING ORGANIC COMPOUNDS
(Continued)

PREFIX NAMES OF ORGANIC RADICALS

This list is taken, by permission, from the Introduction to the Subject Index of *Chemical Abstracts*, Volumes 31 and 33, and represents the latest practice of that journal.

acenaphthenyl $C_{12}H_9$— (*from acenaphthene*)
acetamido CH_3CONH—
acetenyl = ethynyl
acetimido $CH_3C(\cdot NH)$—
acetonyl CH_3COCH_2—
acetonylidene CH_3COCH=
acetoxy CH_3COO—
acetyl CH_3CO—
acetylene =CHCH=
acridyl $C_{13}H_8N$— (*from acridine*)
acrylyl CH_2:CHCO—
adipyl —$OC(CH_2)_4CO$—
alanyl CH_3CHNH_2CO—
alkoxy RO— (*R = any alkyl radical*)
allyl CH_2:CHCH_2—
β-allyl = isopropenyl
amidoxalyl = oxamyl
amino (amido) H_2N—
amoxy $CH_3(CH_2)_4O$—
amyl $CH_3(CH_2)_4$—

tert-amyl $(CH_3CH_2)(CH_3)_2C$—

amylidene $CH_3(CH_2)_3CH$=
anilino C_6H_5NH—
anisal = anisylidene
anisoyl *p*-$CH_3OC_6H_4CO$—
anisyl = methoxyphenyl
anisylidene *p*-$CH_3OC_6H_4CH$=
anthranoyl *o*-$H_2NC_6H_4CO$—
anthraquinonyl $C_{14}H_7O_2$—(*from anthraquinone, 2 isomers*)
anthryl $C_{14}H_9$— (*from anthracene, 3 isomers*)
anthrylene —$C_{14}H_8$— (*from anthracene, 14 isomers*)
antimono —Sb:Sb—
antipyryl (*from antipyrine*)

triazinyl $C_3H_2N_3$— (*from triazine*)
triazo N_3—
triazolyl $C_2H_2N_3$— (*from triazole*)
trimethylene —$CH_2CH_2CH_2$—
tryptophyl $C_{11}H_{11}N_2O$— (*from tryptophan*)
tyrosyl *p*-$HOC_6H_4CH_2CHNH_2CO$— (*from tyrosine*)
undecyl = hendecyl (in sense $C_{11}H_{23}$—)
uramino = ureido
ureido H_2NCONH— (*by some used synonymously with ureylene*)
ureylene —HNCONH—
valeryl $CH_3(CH_2)_3CO$—
valyl $(CH_3)_2CHCHNH_2CO$— (*from valine*)
vanillal = vanillylidene
vanilloyl 3,4-$(CH_3O)(HO)C_6H_3CO$—
vanillyl 3,4-$(CH_3O)(HO)C_6H_3CH_2$—
vanillylidene 3,4-$(CH_3O)(HO)C_6H_3CH$=
veratral = veratrylidene
veratroyl 3,4-$(CH_3O)_2C_6H_3CO$—
veratryl 3,4-$(CH_3O)_2C_6H_3CH_2$—
veratrylidene 3,4-$(CH_3O)_2C_6H_3CH$=
vinyl $H_2C:CH$—
vinylene —CH:CH—
vinylidene $H_2C:C$=
xanthyl $C_{13}H_9O$— (*from xanthene, 6 isomers*)
xyloyl $(CH_3)_2C_6H_3CO$— (*from xylic acid 7 isomers*)
xylyl $(CH_3)_2C_6H_3$—
xylylene —$H_2CC_6H_4CH_2$—

EXPLANATION OF TABLE

The table presents data for over 5000 compounds. They have been selected to include those of general or commercial importance as well as those commonly met with in the laboratory.

Arrangement. The entries are arranged alphabetically by *parent compounds*, substituting atoms and groups like bromo-, chloro-, ethyl-, methyl-, nitro-, etc. being placed after the rest of the name instead of before it; e.g., Acetic acid, dichloro- (and not Dichloroacetic acid). This practice, which is followed in some of the indexes to journals, makes it possible to bring many derivatives of the same parent together. Radicals such as propyl, butyl and amyl, and also compounds such as butyric acid and valeraldehyde, are assumed to be of normal structure unless otherwise stated.

Nomenclature. Compounds are indexed under their common names wherever these are acceptable, but a large number of *synonyms* and *cross references* are included. In particular, many names formed according to the International Union Rules (see preceding pages) are given and are distinguished by the symbol (*). Trade mark names are in quotations.

An **alphabetic order of substituting radicals** is employed in each name; e.g., Ether, ethyl methyl (not Ether, methyl ethyl). For a table of radicals, see preceding pages.

Acids are entered under their "trivial" names where these exist. Systematic names are derived from trivial names where this is feasible; as, Valeric acid, α-bromo-.

Alcohols. Important alcohols having common names, as Amyl alcohol, Isoamyl alcohol, Propyl alcohol, are so entered. For others the International Union names are used; as, 3-Buten-1-ol.

Aldehydes and **amides** are usually entered under names derived from the acid name; as, Propionaldehyde, Propionamide (from propionic acid).

Amines will be found under their usual names; as, Ethylamine, Triethylamine, Ethylenediamine.

Carbylamines are entered as Ethyl isocyanide, Phenyl isocyanide, etc.

Cyanides. See Nitriles, below.

Esters of organic acids will in general be found under the names of the corresponding acids, but those of glycerol and glycol are under the names of the alcohols. Esters of inorganic acids have independent entries; as, Ethyl sulphate, Ethylsulfuric acid.

Ethers. Simple, unsubstituted ethers occur under their own names; as, Ethyl ether, Phenyl ether. Most other monoethers are under *Ether*; as, Ether, isoamyl phenyl.

Halogen derivatives of hydrocarbons, when simple, are entered under their common names (as, Propyl chloride) or, when more complex, under their International Union names (as, 1-Pentane, 2-chloro-).

Hydrazine derivatives are found under *Hydrazine* or, if monoacyl derivatives, under the name of the corresponding acid (as, Benzoic acid, hydrazide). But **hydrazones** are placed under the corresponding carbonyl compound (as, Acetone, phenylhydrazone).

Hydrocarbons of the aliphatic series are entered under their Geneva (International Union) names; other hydrocarbons, under their commonly accepted names.

Isocyanides (Isonitriles) are named as Ethyl isocyanide, Phenyl isocyanide, etc.

Ketones having simple names are so entered (e.g., Acetone, Acetophenone); others are given International Union names if possible (as, 2-Butanone). Those familiar with "ketone" names will find a number of cross references under *Ketone*.

Mercaptans are named, according to the International Union rule, as Ethanethiol (C_2H_5SH), Benzenethiol (C_6H_5SH), etc.

Metallic salts of organic acids will be found in the preceding table, "Physical Constants of Inorganic Compounds."

Metal-organic compounds should be looked for under the name of the metal; as, Lead, tetraethyl-.

Nitriles (cyanides) are given names derived from the corresponding acid, as, Acetonitrile.

Oximes are entered under the corresponding **carbonyl compound**; as, Formaldehyde, oxime.

Phenols will be found under their usual names; as, Phenol, Resorcinol.

Salts of bases are entered under the names of the bases; as, **Aniline**, hydrochloride. For metal salts of organic acids see the preceding table, "Physical Constants of Inorganic Compounds."

Semicarbazones are placed under the corresponding **carbonyl compound**; as, Acetone, semicarbazone.

Sulfides, sulfones and **sulfoxides** are treated like ethers (see **Ethers**, above); as, **Ethyl** sulfide; **Sulfone**, ethyl phenyl.

Sulfonic acids are named as Ethanesulfonic acid, **Naphthalenedisulfonic** acid, etc.

Boldface type is used to distinguish the parent compounds and their substituting radicals. When a parent compound is followed by derivatives its name is not repeated but is replaced in each succeeding entry by a dash.

Formulas. Structural formulas have been given in most cases, and the structure has been indicated as fully as is feasible without taking undue space.

Numbers have been assigned to all compounds to facilitate identification of data on the right hand page and for use in connection with the formula, melting point and boiling point indexes which immediately follow the table. Since the original numbering, some items have been deleted and many others added resulting in occasional breaks in the succession and the occurrence of letters in combination with the numbers.

Crystalline form and **color** are stated in easily interpreted abbreviations. Other important characteristics are often added. The **index of refraction**, follows. For crystals of two or three indices they are invariably given in the order ω, ϵ or α, β, γ. The **specific rotation**, $[\alpha]$, is given for certain compounds. Temperature and wavelength are indicated by the superior and inferior figures and letters following the numerical value. When not otherwise indicated the index of refraction and specific rotation are understood to be at 20°C. and for sodium light.

For example: 1.5236^{20}_{D} indicates an index of refraction of 1.5236 for sodium light ($\lambda = 589.3$ mμ) at 20°C; $[\alpha] - 65.6^{\circ 20}_{D}$ indicates a negative specific rotation of 65.6° for sodium light and a temperature of 20°C.

Density, is normally given in grams per milliliter, at 20°C, numerically equivalent to the specific gravity at 20° referred to water at 4°C. Specific gravity at other temperatures is shown with superior and inferior figures indicating, respectively, the temperature of the substance and that of water to which it is referred. The density of gases is given in grams per liter at 0°C and 760 mm Hg pressure unless otherwise indicated.

Example: 1.536 indicates a density in grams per milliliter at 20°C; 1.634^{25}_{4} indicates a specific gravity of 1.634 at 25°C referred to water at 4°. 2.143g/l indicates the density of a gas at standard conditions, 0°C and 760 mm pressure, as 2.143 grams per liter.

Melting point and **boiling point** are given in °C. Other effects of temperature elevation such as dehydration, sublimation, decomposition, explosion are recorded in connection with the melting or boiling points. Decomposition on heating is indicated by the abbreviation **d.** If decomposition occurs at a definite temperature, the form d. 120 is used, while 120 d. indicates melting or boiling at 120°C with decomposition. Loss of water of crystallization is indicated by $-H_2O$. The boiling point is stated at normal atmospheric pressure (760 mm of Hg) unless otherwise indicated by a superior figure which shows the pressure in millimeters under which the compound boils at the temperature given.

Example: 125^{720} indicates a boiling point of 125°C at a pressure of 720 mm.

Solubility is stated in grams of substance dissolving in 100 ml of the solvent. Normal room temperatures, 20°C, is assumed unless the temperature is indicated by a superior figure The term insoluble (i.) must usually be interpreted to mean that a negligible quantity of the compound dissolves. Many compounds commonly regarded as insoluble really dissolve to a slight extent. The terms very soluble (v.s.), soluble (s.), slightly soluble

EXPLANATION OF TABLE (Continued)

(sl.s.) are used for lack of definite figures. Conflicting statements are very common in the literature. Quantitative statements of solubility are likewise subject to uncertainty due to inexact statement of conditions. Values may be variously stated as parts by weight of solute in parts by weight or volume of the solvent or of the solution, and values are often given and quoted in the literature without proper designation. In the large number of values given there are many which are uncertain in this respect.

The form s. d. indicates solubility with more or less decomposition. The occurrence of d. alone in the statement of solubility indicates that decomposition is the primary action. The statement of solubility in acids or alkalis is usually understood to be accompanied by decomposition.

The policy has been followed of giving the solubility in water, ethyl alcohol and ethyl ether first, followed by statements in regard to other solvents.

As examples:

23.4^{20} indicates a solubility of 23.4 grams of the substance in 100 ml of solvent at 20°C.

250 cm^3 al. indicates the solubility of a gas in ethyl alcohol as 250 cm^3 or ml of the gas in 100 ml of alcohol.

∞^{35} indicates that the substance is miscible with the solvent above 35°C.

Molecular weights have been computed to the nearest hundredth according to the atomic weights of 1939.

	Benzene, diethyl	-). For die	thyl esters o	f organic ac	ids see th	e acids.	

For explanations and abbreviations see beginning of table.

No.	Name	Synonyms	Formula	Mol. Wt.
3216	**Diethylamine***	... .	$(C_2H_5)_2NH$ ..	73 14
3217	—, diethylthiolthionocarbamate.	See under *Carbamic acid, diethylthiolthiono-*.		
3218	—, hydrochloride .	diethylammonium chloride*.	$(C_2H_5)NH\ HCl$....	109.60
3219	**—, *N*-cyano-.**	See *Cyanamide, diethyl-*.		
3219M	**—, 2,2′-diamino-.**	See *Diethylenetriamine*.		
3220	**—, β,β′-dihydroxy-.**	See *Diethanolamine*.		
3221	**—, β,β′-dihydroxy-*N*-methyl-.**	See *Ethanol, 2,2′-methyliminodi-*.		
3222	**—, *N*-formyl-.**	See *Formamide, N,N-diethyl-*.		
3223	**—, β-hydroxy-.**	See *Ethanol, 2-ethylamino-**.		
3224	**—, *N*-methyl-**..	. . . .	$(C_2H_5)_2NCH_3$.	87 16
3225	**—, *N*-nitro-**..	diethylnitramine, nitric diethylamide	$(C_2H_5)_2NNO_2$	118.14
3226	**—, *N*-nitroso-**.......	diethylnitrosamine; nitrous diethylamide	$(C_2H_5)_2NNO$.	102.14
3227	**—, *N*-phenyl-.**	See *Aniline, N,N-diethyl-*.		
3228	**Diethylenediamine.**	See *Piperazine*.		
3229	**Diethylene dioxide.**	See *p-Dioxane*.		
3230	**Diethylene disulfide.**	See *p-Dithiane*.		
3231	**Diethylene glycol** . ..	2,2′-oxydiethanol; 2,2′-dihydroxyethyl ether	$O(CH_2CH_2OH)_2$...	106 12
3232	—, diethyl ether.	See *Ether, bis (β-ethoxyethyl)*.		
3233	—, dioleate......	... .	$(C_{17}H_{33}COOC_2H_4)_2O$	635 00
3234	—, distearate......	glycosterin .	$(C_{17}H_{35}COOC_2H_4)_2O$	639 03
3235	—, monobutyl ether	2-(β-butoxyethoxy)ethanol*; butyl "Carbitol"	$C_4H_9OCH_2CH_2OCH_2CH_2OH$	162 23
3236	—, monobutyl ether acetate	... .	$C_4H_9O(CH_2)_2O(CH_2)_2OOCCH_3$	204.26
3237	—, monoethyl ether.	2-(β-ethoxyethoxy)ethanol*, "Carbitol"	$C_2H_5OCH_2CH_2OCH_2CH_2OH$	134 17
3238	—, monoethyl ether acetate	.	$C_2H_5O(CH_2)_2O(CH_2)_2OOCCH_3$	176 21
3238M	—, monolaurate . .	"Glaurin"......	$C_{11}H_{23}COOC_2H_4OC_2H_4OH$	288 42
3239	—, monomethyl ether	2-(β-methoxyethoxy)ethanol*, methyl "Carbitol"	$CH_3OCH_2CH_2OCH_2CH_2OH$	120 15
3240	**Diethylene oxide 2-iminoethyl alcohol.**	See *4-Morpholinethanol*.		
3240M	**Diethylenetriamine**	2,2′-diaminodiethylamine .	$(NH_2C_2H_4)_2NH$ ..	103 17
3241	**Diethylenimide oxide.**	See *Morpholine*.		
3242	**Diethyl ether.**	See *Ethyl ether*.		
3242H	**Diethyl formal.**	See *Methane, diethoxy-*.		
3242R	**Diethylolamine.**	See *Diethanolamine*.		
3243	**Diethylphosphoric acid**	diethyl hydrogen phosphate	$PO(OC_2H_5)_2OH$	154 11
3244	**Diethyl sulfate.**	See *Ethyl sulfate*.		
3245	**Diethyl sulfite.**	See *Ethyl sulfite*.		
3246	**Difurfurylamine**.. .	α,α′-di-2-furyldimethylamine	$(C_4H_3OCH_2)_2NH$	177 20
3247	***m*-Digallic acid** ..	gallic acid 3-monogallate .	$C_{14}H_{10}O_9$	322 22
